IMPORTANT STATEMENT

PADAUK Technology reserves the right to make changes to its products or terminate production of its products at any time without notice. Customers are strongly recommended to contact PADAUK Technology for the latest information and verify whether the information is correct and complete before placing orders.

PADAUK Technology products are not warranted to be suitable for use in life-support applications or other critical applications. PADAUK Technology assumes no liability for such applications. Critical applications include, but are not limited to, those which may involve potential risks of death, personal injury, fire or severe property damage.

Any programming software provided by PADAUK Technology to customers is of a service and reference nature and does not have any responsibility for software vulnerabilities. PADAUK Technology assumes no responsibility for any issue caused by a customer's product design. Customers should design and verify their products within the ranges guaranteed by PADAUK Technology. In order to minimize the risks in customers' products, customers should design a product with adequate operating safeguards.

Revision History:

Revision	Date	Description
0.01	2021/03/23	1 st version
0.02	2025/07/16	1. Update URL for Writing application software and User Manual
0.02	2023/07/10	2. Added Off-line Program Setting

1. 5S-P-C01 Simplified Writer Description

1.1. Simplified Writer

Fig.1

- (1) USB interface
- (2) Power LED
- (3) Boot loader button: Force-entering Boot loader mode only.
- (4) LED set: There are 6 led in total. The LED state represents whether the writing pins are well-connected, which corresponds to VDD, PA3, PA4, PA5, PA6 and GND from right to left.
- (5) Writing interface: There are 6 PIN in total, corresponding to IC's VDD, PA3, PA4, PA5 and GND from bottom to top.
- (6) Software ICE interface: About its related functions, please refer to Software ICE user manual.

1.2. Writing application software and User Manual

You can download the latest version of the application software at the following address (including the latest version of the Writer).

Enter the home page of <u>Padauk</u> to obtain latest Program Writer version from <u>home page > technology</u> <u>application > technology development tool > Program Writer.</u>

2. Function Description

2.1. Writing Mode

- Writing Software (Fig. 2)
 - (1) Program Writer operation

It is similar to 5S-P003 Program Writer operation but there are still some differences between them. After Load File, it will prompt to connect the 5S-P-C01 program interface with the IC pin correspondingly.

If AVDD and AGND pin exist, you need to short circuit VDD/GND and AVDD/ AGND of the IC respectively or connect IC_AVDD/IC_AGND with the VDD_PIN/GND_PIN of writing interface.

PADAUK : 5S-P-003-S	[*VER_XXX]
Load File	PHS150C Check Sum : 0x3A12AB C:\Users\
Blank Check	Convert Verify TestSuit
Auto Program	Date = 2019/10/29 15:36:17 SYSCLK = 16 HHz/8 UDD = No Set LUR = 2.00 Protect = Security 7/8
	Writing pins prompt
Detail Message	Download OK Check Jump : Hone Program Pin: UDD PA3 PA4 PA5 PA6 GND note: IC exist AVDD/AGND => VDD-AVDD short, GND-AGND short

Fig.2

- (2) When loading PDK, it may cause the writer to update automatically, and the new PDK will be autoloaded after the update.
- (3) Note: The former series IC are not supported.

When loading PDK, the writer auto-identify the supported PDK. When an unsupported PDK is selected, the following prompt appears, as shown in Fig. 3.

PADAUK : 5S-P-003-S [*VER_XXX]		
Load File	PHC271 Check Sun : 0x8	IS 8068 858_PHC2	
Blank Check	Fail command. fer 確定	5LUDSU	ıs_1s
Auto Program	Date = 2020/03/20 14:40:52 SYSCLK = ILRC UDD LVR = 2.5V Prote	= No Se ct = Secur	

Writing IC interface (Fig. 4-1/ Fig. 4-2/ Fig. 4-3)

- (1) The connection mode in whole is shown in figure 4-1.
- (2) The LED set represents connection status, as shown in figure 4-2.
- (3) The writer interface pins correspond to VDD / PA3 / PA4 / PA5 / PA6 / GND form the bottom to the top, as shown in figure 4-3. The writer interface is header 2*6 pin with every two pins short-circuited (facilitate signal measurement and the connection of IC Analog power PIN).

When the IC to be written is well-placed, LED keeps on means connection fail and LED keeps off means that all pins are well-connected.

If any LED keeps on, please reconfirm the connection.

When the LED set (D1~D6) is all off, it means that the writer is ready.

Special Note: The corresponding LED only indicates that the pin is connected, and cannot represent a correct connection.

For example, if the writing interface PA3_PIN is carelessly connected to the IC_PA4 pin, the corresponding LED will still off, but errors will happen in subsequent writing operation. (ex: Find different IC, Not to IC...etc.). At this time, please confirm the connection is right.

Fig.4-1

A5 PA4 PA3 VDD LED set	

Fig.4-2

Fig.4-3

• LED set State Description (Writing Mode)

Writer state	LED state	Remarks
Waiting loading PDK	LED(D1, D3, D5) keep switching ON and OFF periodically.	
Waiting loading PDK (Not Load File)	LED(D2, D4, D6) keep switching OFF and ON periodically.	
(Not Load File)	The two LED groups are blinking in turn.	
	When the connection is wrong, the LEDs keep ON.	
Confirming the connection	When the connection is right, the LEDs keep OFF.	
	When the LED D1~D6 are all off, user can start to write IC.	
Loose contact	Random LEDs keep ON.	
Writing IC	LED D1~D6 are all OFF.	
	LED(D1, D2, D3) keep switching ON and OFF periodically.	
Writer Software Updating	LED(D4, D5, D6) keep switching OFF and ON periodically.	
The two LED	The two LED groups are blinking in turn.	
Needing forcing update	LED D1~D6 flach fact synchronously	
(please refer to section 2.1)	LED D1~D6 flash fast synchronously	

On-board Program Setting

Method one: set through option 『On-board Program』,

The operation is as follows: 『Convert』 → 『Check IC… 』 → 『On-board Program 』

Fig.5

Method two: set through option [To Package],

The operation is as follows: 『Convert』 → 『To Package』 → 『On-board Program』

	Convert	Verify		Package Setting			
	1 Ciny			IC SP1811	•	□ 0/S Any - 1	20 Any - 0/S
				Package S20/D20	-	₩ 0/S PA3 - 2	19 Any - 0/S

Ĺċ	Check IC				OK	Cancel	

• Off-line Program Setting

Load the program to be programmed into the 5S-P-C01. (It supports offline programming for any IC.) When the LED group (D1~D6) is completely off, it indicates that the IC is ready. At this time, press the SW1 KEY to start programming. When the LED group (D1 and D2) is on, it means the IC programming is completed; when the LED group (D5 and D6) is on, it indicates that the programming has failed.

• LED Indicator Light Group Signal Description List (Offline Programming Mode)

LED status	Writer Status	Note
LEDs (D1~D6) are all 『OFF』	IC Ready	
LEDs (D3 D4) flash fast synchronously	Programming in progress	
LEDs (D1 D2) are all 『ON』	Programming completed	
LEDs (D5 D6) are all 『ON』	Programming failed	

2.2. Forcing Update Mode (Bootloader Button Function)

- When to use it: use this function to force into Bootloader update mode when something unexpected happens, such as update interruption or update error.
- How to enter it: keep pressing the Bootloader button, then connect the USB cable, and release the button after seeing the LED sets start to turn ON.
- How to update: open the IDE and enter the programming software to update. The software auto-returns to writing mode after update. (Fig. 7)

• LED Set State Description (Update Mode)

烧录器状态		LED 状态	备注
	LED (D1~D6)		
	D1	ON	
	D1 D2	ON	
Waiting to update	D1 D2 D3	ON	
	D1 D2 D3 D4 D5 D6	ON	
	The LED will be ON or	ne by one in sequence and cycle	
	LED(D1.D2.D3) keep	switching ON and OFF periodically.	
Start to update and check	LED(D4.D5.D6) keep		
	The two LED groups a	re blinking in turn.	
	LED(D1~D6)are all	ON.	
Update error	LED(D1~D6)are all	OFF.	
Opuale entit	The two LED groups a	re blinking in turn	
	(please refer to section	a 2.1 and force update again).	
Update completed	Automatically leave up	date mode and enter writing mode.	
	Relevant LEDs in this	mode, please refer to chap writing mode.	
	LED (D1.D2.D5.D6) a	are all ON.	
Fail to entry writing mode	LED (D3.D4) are all OFF.	DFF.	
	After keeping these sta	ates for 0.5s, the writer will enter "waiting to	
	update" mode automat	tically.
