IMPORTANT NOTICE

PADAUK Technology reserves the right to make changes to its products or to terminate production of its products at any time without notice. Customers are strongly recommended to contact PADAUK Technology for the latest information and verify whether the information is correct and complete before placing orders.

PADAUK Technology products are not warranted to be suitable for use in life-support applications or other critical applications. PADAUK Technology assumes no liability for such applications. Critical applications include, but are not limited to, those which may involve potential risks of death, personal injury, fire or severe property damage.

Any programming software provided by PADAUK Technology to customers is of a service and reference nature and does not have any responsibility for software vulnerabilities. PADAUK Technology assumes no responsibility for any issue caused by a customer's product design. Customers should design and verify their products within the ranges guaranteed by PADAUK Technology. In order to minimize the risks in customers' products, customers should design a product with adequate operating safeguards.

Revision History

| Revision | Date | Description |
|----------|------------|---|
| 1.08 | 2024/08/23 | 1. Updated description of Special Features |
| 1.09 | 2025/09/02 | 1. Amend the description in Section 5.12.1: Add the sentence “It will be triggered on both the rising and falling edges” and delete “\$ <i>INTEGS BIT_R</i> , <i>xxx</i> ,” . 2. Amend the description in Section 9.2: When GPCS selects output to PA0, the output function of PA3 will be affected. |

Usage Warning

User must read all application notes of the IC by detail before using it.

Please visit the official website to download and view the latest APN information associated with it.

1. Features

1.1. Special Features

- ◆ General purpose series
- ◆ In applications with AC RC step-down power supply or high EFT requirements, the system circuit needs to be modified if necessary to improve the anti-interference capability
- ◆ Operating temperature range: -40°C ~ 85°C

1.2. System Features

| Series | OTP program memory | RAM (byte) | Max IO no. | Max ADC Channel no. |
|--------|--------------------|------------|------------|---------------------|
| PMS133 | 3KW | 256 | 18 | 14 |
| PMS134 | 4KW | 256 | 22 | 14 |

- ◆ One hardware 16-bit timer
- ◆ Two hardware 8-bit timers with PWM generation
- ◆ Three hardware 11-bit PWM generators (PWMG0, PWMG1 & PWMG2)
- ◆ One hardware comparator
- ◆ Bandgap circuit to provide 1.2V reference voltage
- ◆ Up to 14-channel 12-bit resolution ADC with one channel comes from internal bandgap reference voltage or $0.25 \times V_{DD}$
- ◆ ADC reference high voltage: external input, internal VDD, Bandgap 1.20V, 4V, 3V, 2V
- ◆ One 1T 8x8 hardware multiplier
- ◆ Max. 22 IO pins with optional pull-high resistor
- ◆ Three different IO Driving capability group to meet different application requirements
 - (1) PB4, PB7 Drive/ Sink Current= 30mA/35mA (Strong) and 13mA/17mA (Normal)
 - (2) Other IOs (except PA5) Drive/ Sink Current = 10mA/(13 or 20) mA
 - (3) PA5 Sink Current = 10mA
- ◆ Every IO pin can be configured to enable wake-up function
- ◆ Built-in VDD/2 LCD bias voltage generator to provide maximum 4x17 dots LCD display
- ◆ Clock sources: IHRC, ILRC and EOSC (XTAL)
- ◆ For every wake-up enabled IO, two optional wake-up speed are supported: normal and fast
- ◆ Eight levels of LVR reset: 4.0V, 3.5V, 3.0V, 2.7V, 2.5V, 2.2V, 2.0V, 1.8V
- ◆ Two selectable external interrupt pins by code option

1.3. CPU Features

- ◆ 8bit high performance RISC CPU
- ◆ 93 powerful instructions
- ◆ Most instructions are 1T execution cycle
- ◆ Programmable stack pointer to provide adjustable stack level
- ◆ Direct and indirect addressing modes for data access. Data memories are available for use as an index pointer of Indirect addressing mode
- ◆ IO space and memory space are independent

1.4. Ordering/ Package Information

◆ PMS133 Series

- ✧ PMS133-U06: SOT23-6 (60mil)
- ✧ PMS133-S08: SOP8 (150mil)
- ✧ PMS133-M10: MSOP10 (118mil)
- ✧ PMS133-S14: SOP14 (150mil)
- ✧ PMS133-S16A: SOP16A (150mil)
- ✧ PMS133-S16B: SOP16B (150mil)
- ✧ PMS133-S20: SOP20 (300mil)
- ✧ PMS133-H20: HTSOP20 (150mil)
- ✧ PMS133-4N10: DFN3*3-10P (0.5pitch)
- ✧ PMS133-2J16A: QFN4*4-16P (0.65pitch)
- ✧ PMS133-1J16A: QFN3*3-16P (0.5pitch)

◆ PMS134 Series

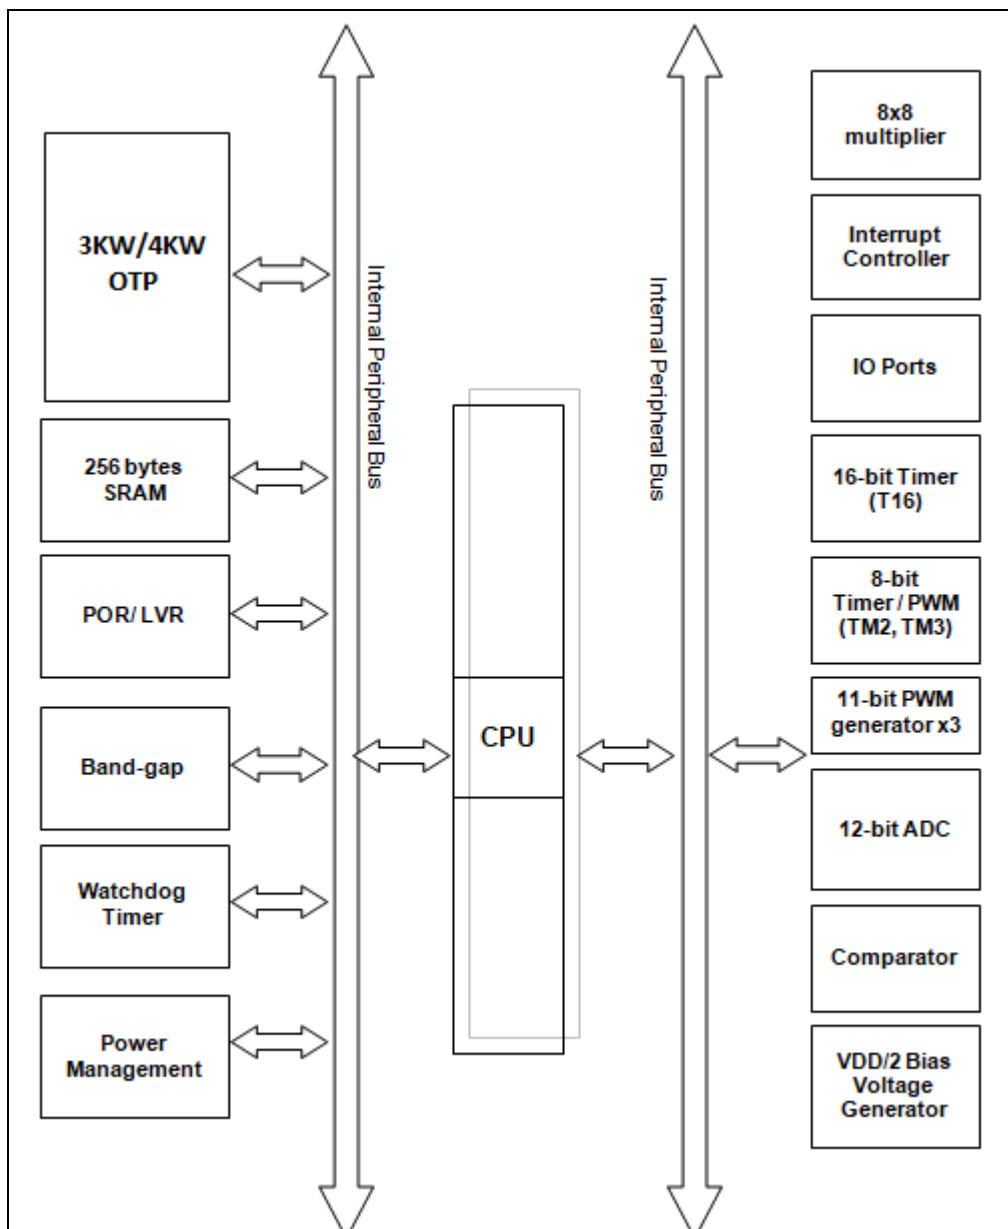

- ✧ PMS134-U06: SOT23-6 (60mil)
- ✧ PMS134-S08: SOP8 (150mil)
- ✧ PMS134-M10: MSOP10 (118mil)
- ✧ PMS134-S14: SOP14 (150mil)
- ✧ PMS134-S16A: SOP16A (150mil)
- ✧ PMS134-S16B: SOP16B (150mil)
- ✧ PMS134-S20: SOP20 (300mil)
- ✧ PMS134-H20: HTSOP20 (150mil)
- ✧ PMS134-S24: SOP24 (300mil)
- ✧ PMS134-Y24: SSOP24 (150mil)
- ✧ PMS134-4N10: DFN3*3-10P (0.5pitch)
- ✧ PMS134-2J16A: QFN4*4-16P (0.65pitch)
- ✧ PMS134-1J16A: QFN3*3-16P (0.5pitch)
- ✧ PMS134-2J24: QFN4*4-24P (0.5pitch)

- Please refer to the official website file for package size information: "Package information "

2. General Description and Block Diagram

The PMS133/PMS134 family is an OTP-based CMOS 8-bit microcontroller with 12bit ADC. It employs RISC architecture and all the instructions are executed in one cycle except that some instructions are two cycles that handle indirect memory access.

Up to 3KW/4KW OTP program memory and 256 bytes data SRAM are inside. One up to 14 channels 12-bit ADC is built inside the chip with multiple reference voltage sources selectable. PMS133/PMS134 also provides six hardware timers: one is 16-bit timer, two are 8-bit timers with PWM generation, and three hardware 11-bit timers with PWM generation are also included. PMS133/PMS134 also supports one hardware comparator and VDD1/2 LCD bias voltage generator for LCD display application.

3. Pin Assignment and Description

PMS133/PMS134-U06: SOT23-6 (60mil)

PMS133/PMS134-S08: SOP8 (150mil)

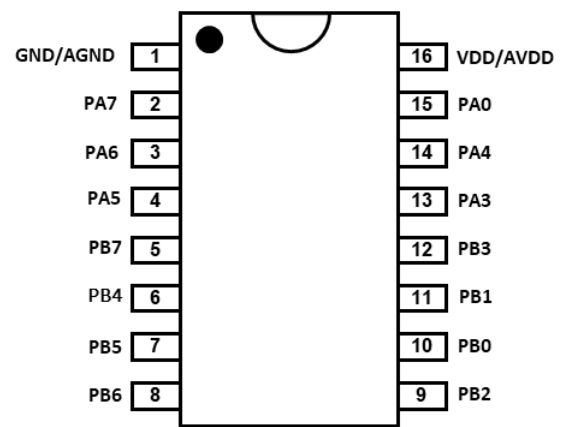

PMS133/PMS134-M10: MSOP10 (118mil)

PMS133/PMS134-S14: SOP14 (150mil)

PMS133/PMS134-S16A: SOP16A (150mil)

PMS133/PMS134-S16B: SOP16B (150mil)

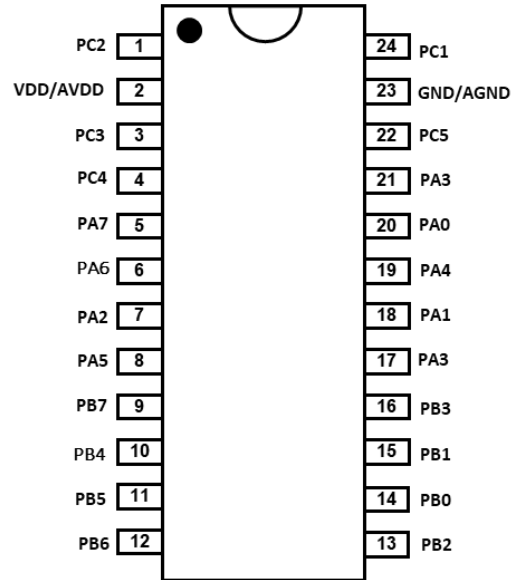

PMS133/PMS134-4N10: DFN3*3-10P (0.5pitch)

PMS133/PMS134

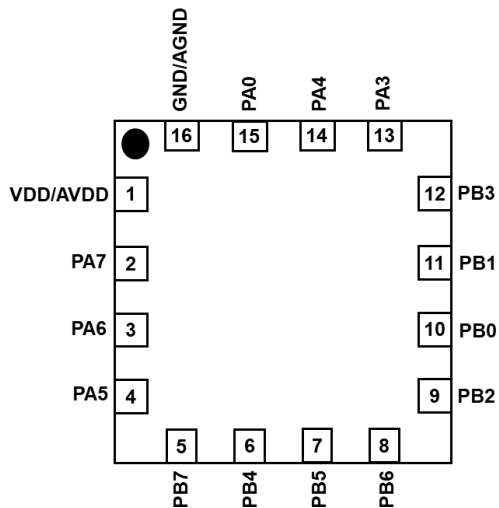

8bit OTP MCU with 12-bit ADC

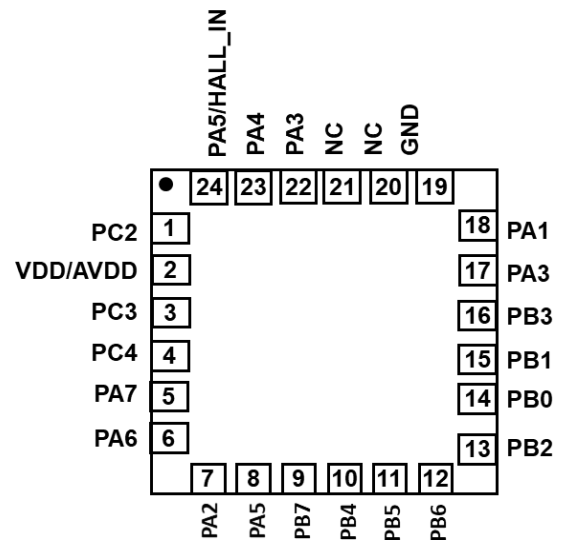

PMS133/PMS134-S20: SOP20 (300mil)
PMS133/PMS134-H20: HTSOP20 (150mil)

PMS134-S24: SOP24 (300mil)
PMS134-Y24: SSOP24 (150mil)

PMS133/PMS134-2J16A: QFN4*4-16P (0.65pitch)
PMS133/PMS134-1J16A: QFN3*3-16P (0.5pitch)

PMS134-2J24: QFN4*4-24P (0.5pitch)

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

| Pin Name | Pin Type & Buffer Type | Description |
|--|--------------------------------|---|
| PA7 / X1 / INT0C | IO ST / CMOS | <p>The functions of this pin can be:</p> <p>(1) Bit 7 of port A. It can be configured as digital input or two-state output, with pull-high resistor.</p> <p>(2) X1 is Crystal XIN(X1) when crystal oscillator is used.</p> <p>(3) External interrupt line 0C. It can be used as an external interrupt line 0. <u>Both rising edge and falling edge are accepted to request interrupt service and configurable by register setting</u></p> <p>If this pin is used for crystal oscillator, bit 7 of padier register must be programmed “0” to avoid leakage current. This pin can be used to wake-up system during sleep mode; however, wake-up function is also disabled if bit 7 of padier register is “0” .</p> |
| PA6 / X2 | IO ST / CMOS | <p>The functions of this pin can be:</p> <p>(1) Bit 6 of port A. It can be configured as digital input or two-state output, with pull-high resistor.</p> <p>(2) X2 is Crystal XOUT(X2) when crystal oscillator is used.</p> <p>If this pin is used for crystal oscillator, bit 6 of padier register must be programmed “0” to avoid leakage current. This pin can be used to wake-up system during sleep mode; however, wake-up function is also disabled if bit 6 of padier register is “0” .</p> |
| PA5 / PRSTB | IO (OD) ST / CMOS | <p>The functions of this pin can be:</p> <p>(1) Bit 5 of port A. It can be configured as digital input or open-drain output, with pull-high resistor.</p> <p>(2) Hardware reset.</p> <p>This pin can be used to wake-up system during sleep mode; however, wake-up function is also disabled if bit 5 of padier register is “0” . <u>Please put 33Ω resistor in series to have high noise immunity when this pin is in input mode.</u></p> |
| PA4 / AD9 / COM3 / CIN+ / CIN1- / INT1A / PG1PWM | IO ST / CMOS / Analog | <p>The functions of this pin can be:</p> <p>(1) Bit 4 of port A. It can be configured as digital input or two-state output, with pull-high resistor by software independently</p> <p>(2) Channel 9 of ADC analog input</p> <p>(3) COM3 to provide (1/2 V_{DD}) for LCD display</p> <p>(4) Plus, input source of comparator.</p> <p>(5) Minus input source 1 of comparator.</p> <p>(6) External interrupt line 1A. It can be used as an external interrupt line 1. <u>Both rising edge and falling edge are accepted to request interrupt service and configurable by register setting</u></p> <p>(7) Output of 11-bit PWM generator PWMG1</p> <p>When this pin is configured as analog input, please use bit 4 of register padier to disable the digital input to prevent current leakage. The bit 4 of padier register can be set to “0” to disable digital input; wake-up function by toggling this pin is also disabled.</p> |

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

| Pin Name | Pin Type & Buffer Type | Description |
|--|--------------------------------|--|
| PA3 / AD8 / COM4 / CIN0- / INT1B / TM2PWM / PG2PWM | IO ST / CMOS / Analog | <p>The functions of this pin can be:</p> <ol style="list-style-type: none"> (1) Bit 3 of port A. It can be configured as digital input or two-state output, with pull-high resistor independently by software (2) Channel 8 of ADC analog input (3) COM4 to provide ($1/2 V_{DD}$) for LCD display (4) Minus input source 0 of comparator. (5) External interrupt line 1B. It can be used as an external interrupt line 1. <u>Both rising edge and falling edge are accepted to request interrupt service and configurable by register setting</u> (6) PWM output from Timer2 (7) Output of 11-bit PWM generator PWMG2 <p>When this pin is configured as analog input, please use bit 3 of register padier to disable the digital input to prevent current leakage. The bit 3 of padier register can be set to “0” to disable digital input; wake-up function by toggling this pin is also disabled.</p> |
| PA2 / INT0B | IO ST / CMOS | <p>The functions of this pin can be:</p> <ol style="list-style-type: none"> (1) Bit 2 of port A. 4.2. Absolute Maximum Ratings

| Parameter | Maximum Rating | Notes |
|-----------------------|-------------------------|--|
| Supply Voltage | 2.2V ~ 5.5V | If V_{DD} is over the maximum rating, it may lead to a permanent damage of IC. |
| Input Voltage | -0.3V ~ $V_{DD} + 0.3V$ | |
| Operating Temperature | -40°C ~ 85°C | |
| Junction Temperature | 150°C | |
| Storage Temperature | -50°C ~ 125°C | |

4.3. Typical ILRC frequency vs. VDD

4.4. Typical IHRC frequency deviation vs. VDD (calibrated to 16MHz)

4.5. Typical ILRC Frequency vs. Temperature

4.6. Typical IHRC Frequency vs. Temperature (calibrated to 16MHz)

4.7. Typical operating current vs. VDD @ system clock = ILRC/n

Conditions: **ON**: ILRC, Bandgap, LVR; **OFF**: IHRC, EOSC, T16, TM2, TM3, ADC modules;
IO: PA0:0.5Hz output toggle and no loading, **others**: input and no floating

4.8. Typical operating current vs. VDD @ system clock = IHRC/n

Conditions: **ON:** IHRC, Bandgap, LVR; **OFF:** ILRC, EOSC, T16, TM2, TM3, ADC modules;

IO: PA0:0.5Hz output toggle and no loading, **others:** input and no floating

4.9. Typical operating current vs. VDD @ system clock = 4MHz EOSC / n

Conditions: **ON:** EOSC[6,5] = [1,1], Bandgap, LVR; **OFF:** IHRC, ILRC, T16, TM2, TM3, ADC modules;

IO: PA0:0.5Hz output toggle and no loading, **others:** input and no floating

4.10. Typical operating current vs. VDD @ system clock = 32KHz EOSC / n

Conditions: **ON**: EOSC[6,5] = [0,1], Bandgap, LVR; **OFF**: IHRC, ILRC, T16, TM2, TM3, ADC modules;

IO: PA0:0.5Hz output toggle and no loading, **others**: input and no floating

4.11. Typical operating current vs. VDD @ system clock = 1MHz EOSC / n

Conditions: **ON**: EOSC[6,5] = [1,0], Bandgap, LVR; **OFF**: IHRC, ILRC, T16, TM2, TM3, ADC modules;

IO: PA0:0.5Hz output toggle and no loading, **others**: input and no floating

4.12. Typical IO driving current (I_{OH}) and sink current (I_{OL})

($V_{OH}=0.9 \cdot V_{DD}$, $V_{OL}=0.1 \cdot V_{DD}$)

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

4.13. Typical IO input high/low threshold voltage (V_{IH}/V_{IL})

4.14. Typical resistance of IO pull high device

4.15. Typical power down current (I_{PD}) and power save current (I_{PS})

5. Functional Description

5.1. Program Memory - OTP

The OTP (One Time Programmable) program memory is used to store the program instructions to be executed. The OTP program memory may contain the data, tables and interrupt entry. After reset, the initial address 0x000 is reserved for system using, so the program will start from 0x001 which is GOTO FPPA0 instruction usually. The interrupt entry is 0x010 if used, the last 16 addresses are reserved for system using, like checksum, serial number, etc. The OTP program memory for PMS133/PMS134 is 3KW/4KW that is partitioned as Table 1. The OTP memory from address 0xFE8 to 0xFFF is for system using, address space from 0x002 to 0x00F and from 0x011 to 0xFE7 are user program spaces.

| Address | Function |
|---------|-------------------------|
| 0x000 | System Using |
| 0x001 | GOTO FPPA0 instruction |
| 0x002 | User program |
| • | • |
| 0x00F | User program |
| 0x010 | Interrupt entry address |
| 0x011 | User program |
| • | • |
| 0xBFF | User program |
| 0xC00 | User Program |
| • | • (Not for PMS133) |
| 0xFE7 | User Program |
| 0xFE8 | System Using |
| • | • |
| 0xFFF | System Using |

Table 1: Program Memory Organization

5.2. Boot Procedure

POR (Power-On-Reset) is used to reset PMS133/PMS134 when power up. The boot up time can be optional fast or normal. Time for fast boot-up is about 45 ILRC clock cycles whereas 3000 ILRC clock cycles for normal boot-up. Customer must ensure the stability of supply voltage after power up no matter which option is chosen, the power up sequence is shown in the Fig. 1 and t_{SBP} is the boot up time.

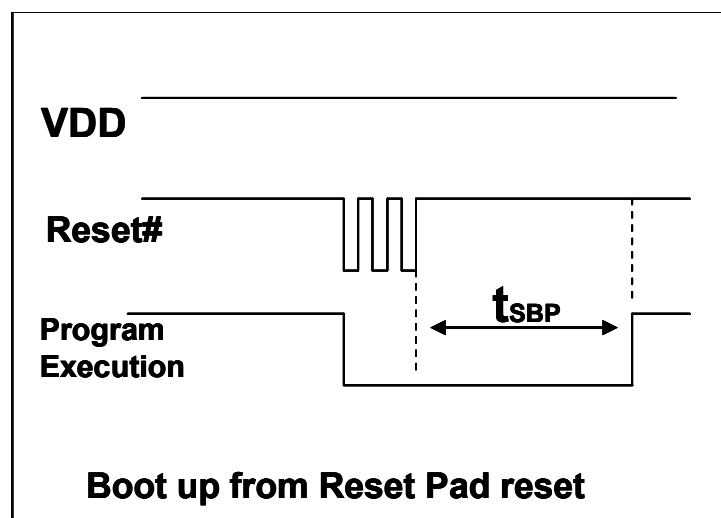

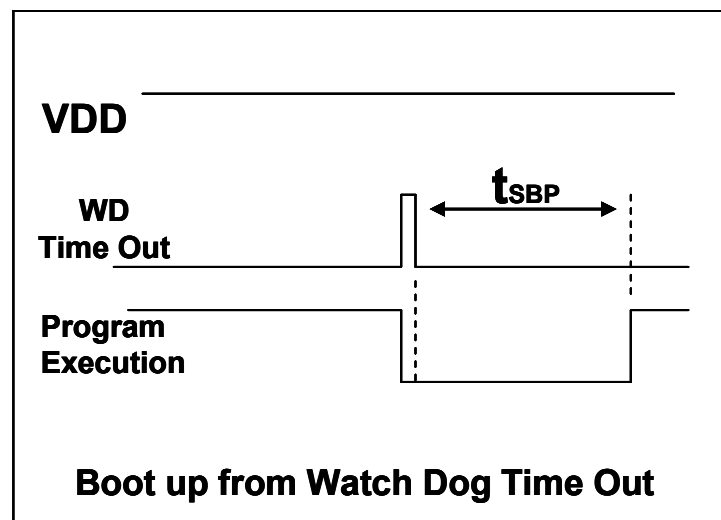

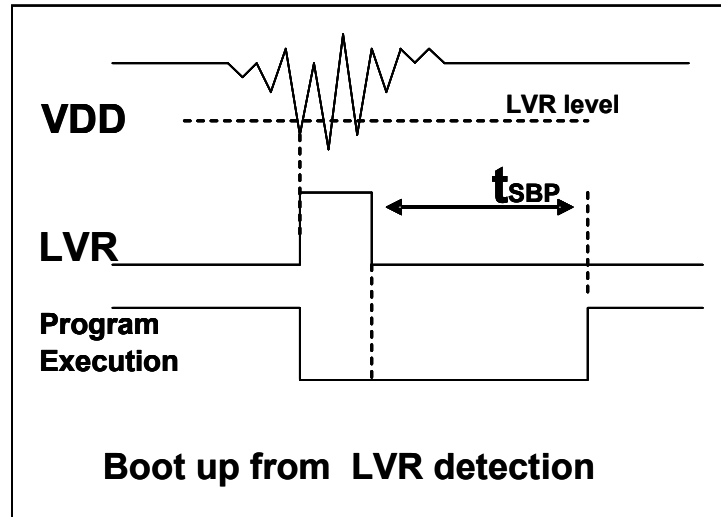

Fig.1: Power-Up Sequence

5.2.1. Timing charts for reset conditions

5.3. Data Memory - SRAM

The access of data memory can be byte or bit operation. Besides data storage, the SRAM data memory is also served as data pointer of indirect access method and the stack memory.

The stack memory is defined in the data memory. The stack pointer is defined in the stack pointer register; the depth of stack memory of each processing unit is defined by the user. The arrangement of stack memory fully flexible and can be dynamically adjusted by the user.

For indirect memory access mechanism, the data memory is used as the data pointer to address the data byte. All the data memory could be the data pointer; it's quite flexible and useful to do the indirect memory access. Since the data width is 8-bit, all the 256 bytes data memory of PMS133/PMS134 can be accessed by indirect access mechanism.

5.4. Oscillator and clock

There are three oscillator circuits provided by PMS133/PMS134: external crystal oscillator (EOSC), internal high RC oscillator (IHRC) and internal low RC oscillator (ILRC), and these three oscillators are enabled or disabled by registers `eoscr.7`, `clkmd.4` and `clkmd.2` independently. User can choose one of these three oscillators as system clock source and use ***clkmd*** register to target the desired frequency as system clock to meet different applications.

| Oscillator Module | Enable/Disable |
|-------------------|-----------------------|
| EOSC | <i>eoscr.7</i> |
| IHRC | <i>clkmd.4</i> |
| ILRC | <i>clkmd.2</i> |

Table 2: Three oscillation circuits

5.4.1. Internal High RC oscillator and Internal Low RC oscillator

After boot-up, the IHRC and ILRC oscillators are enabled. The frequency of IHRC can be calibrated to eliminate process variation by ***ihrcr*** register; normally it is calibrated to 16MHz. Please refer to the measurement chart for IHRC frequency verse V_{DD} and IHRC frequency verse temperature.

The frequency of ILRC will vary by process, supply voltage and temperature, please refer to DC specification and do not use for accurate timing application.

5.4.2. Chip calibration

The IHRC frequency and bandgap reference voltage may be different chip by chip due to manufacturing variation, PMS133/PMS134 provide the IHRC frequency calibration to eliminate this variation, and this function can be selected when compiling user's program and the command will be inserted into user's program automatically. The calibration command is shown as below:

`.ADJUST_IC SYSCLK=IHRC/(p1), IHRC=(p2)MHz, VDD=(p3)V;`

Where, **p1**=2, 4, 8, 16, 32; In order to provide different system clock.

p2=14 ~ 18; In order to calibrate the chip to different frequency, 16MHz is the usually one.

p3=2.5 ~ 5.5; In order to calibrate the chip under different supply voltage.

5.4.3. IHRC Frequency Calibration and System Clock

During compiling the user program, the options for IHRC calibration and system clock are shown as Table 3:

| SYSCLK | CLKMD | IHRCR | Description |
|-------------------------------------|-------------------|--------------|--|
| <input type="radio"/> Set IHRC / 2 | = 34h (IHRC / 2) | Calibrated | IHRC calibrated to 16MHz, CLK=8MHz (IHRC/2) |
| <input type="radio"/> Set IHRC / 4 | = 14h (IHRC / 4) | Calibrated | IHRC calibrated to 16MHz, CLK=4MHz (IHRC/4) |
| <input type="radio"/> Set IHRC / 8 | = 3Ch (IHRC / 8) | Calibrated | IHRC calibrated to 16MHz, CLK=2MHz (IHRC/8) |
| <input type="radio"/> Set IHRC / 16 | = 1Ch (IHRC / 16) | Calibrated | IHRC calibrated to 16MHz, CLK=1MHz (IHRC/16) |
| <input type="radio"/> Set IHRC / 32 | = 7Ch (IHRC / 32) | Calibrated | IHRC calibrated to 16MHz, CLK=0.5MHz (IHRC/32) |
| <input type="radio"/> Set ILRC | = E4h (ILRC / 1) | Calibrated | IHRC calibrated to 16MHz, CLK=ILRC |
| <input type="radio"/> Disable | No change | No Change | IHRC not calibrated, CLK not changed |

Table 3: Options for IHRC Frequency Calibration

Usually, `.ADJUST_IC` will be the first command after boot up, in order to set the target operating frequency whenever starting the system. The program code for IHRC frequency calibration is executed only one time that occurs in writing the codes into OTP memory; after then, it will not be executed again. If the different option for IHRC calibration is chosen, the system status is also different after boot. The following shows the status of PMS133/PMS134 for different option:

(1) `.ADJUST_IC SYSCLK=IHRC/2, IHRC=16MHz, VDD=5V`

After boot up, CLKMD = 0x34:

- ◆ IHRC frequency is calibrated to 16MHz@V_{DD}=5V and IHRC module is enabled
- ◆ System CLK = IHRC/2 = 8MHz
- ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode

(2) `.ADJUST_IC SYSCLK=IHRC/4, IHRC=16MHz, VDD=3.3V`

After boot up, CLKMD = 0x14:

- ◆ IHRC frequency is calibrated to 16MHz@V_{DD}=3.3V and IHRC module is enabled
- ◆ System CLK = IHRC/4 = 4MHz
- ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode

(3) .ADJUST_IC SYSCLK=IHRC/8, IHRC=16MHz, V_{DD}=2.5V

After boot up, CLKMD = 0x3C:

- ◆ IHRC frequency is calibrated to 16MHz@V_{DD}=2.5V and IHRC module is enabled
- ◆ System CLK = IHRC/8 = 2MHz
- ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode

(4) .ADJUST_IC SYSCLK=IHRC/16, IHRC=16MHz, V_{DD}=2.5V

After boot up, CLKMD = 0x1C:

- ◆ IHRC frequency is calibrated to 16MHz@V_{DD}=2.5V and IHRC module is enabled
- ◆ System CLK = IHRC/16 = 1MHz
- ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode

(5) .ADJUST_IC SYSCLK=IHRC/32, IHRC=16MHz, V_{DD}=5V

After boot up, CLKMD = 0x7C:

- ◆ IHRC frequency is calibrated to 16MHz@V_{DD}=5V and IHRC module is enabled
- ◆ System CLK = IHRC/32 = 500KHz
- ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode

(6) .ADJUST_IC SYSCLK=ILRC, IHRC=16MHz, V_{DD}=5V

After boot up, CLKMD = 0xE4:

- ◆ IHRC frequency is calibrated to 16MHz@V_{DD}=5V and IHRC module is disabled
- ◆ System CLK = ILRC
- ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is input mode

(7) .ADJUST_IC DISABLE

After boot up, CLKMD is not changed (Do nothing):

- ◆ IHRC is not calibrated and IHRC module is disabled
- ◆ System CLK = ILRC or IHRC/64
- ◆ Watchdog timer is enabled, ILRC is enabled, PA5 is in input mode,

5.4.4. External Crystal Oscillator

If crystal oscillator is used, a crystal or resonator is required between X1 and X2. Fig.2 shows the hardware connection under this application; the range of operating frequency of crystal oscillator can be from 32 KHz to 4MHz, depending on the crystal placed on; higher frequency oscillator than 4MHz is NOT supported.

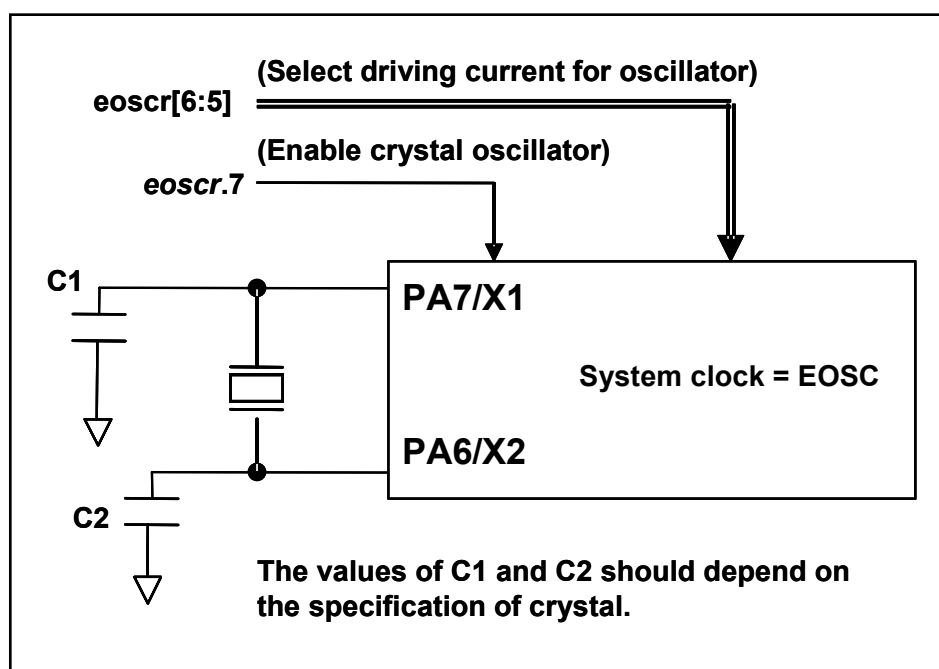

Fig.2: Connection of crystal oscillator

Besides crystal, external capacitor and options of PMS133/PMS134 should be fine-tuned in *eoscr* (0x0a) register to have good sinusoidal waveform. The *eoscr.7* is used to enable crystal oscillator module, *eoscr.6* and *eoscr.5* are used to set the different driving current to meet the requirement of different frequency of crystal oscillator:

- ◆ *eoscr*.[6:5]=01 : Low driving capability, for lower frequency, ex: 32KHz crystal oscillator
- ◆ *eoscr*.[6:5]=10 : Middle driving capability, for middle frequency, ex: 1MHz crystal oscillator
- ◆ *eoscr*.[6:5]=11 : High driving capability, for higher frequency, ex: 4MHz crystal oscillator

Table 4 shows the recommended values of C1 and C2 for different crystal oscillator; the measured start-up time under its corresponding conditions is also shown. Since the crystal or resonator had its own characteristic, the capacitors and start-up time may be slightly different for different type of crystal or resonator, please refer to its specification for proper values of C1 and C2.

| Frequency | C1 | C2 | Measured Start-up time | Conditions |
|-----------|-------|-------|------------------------|--|
| 4MHz | 4.7pF | 4.7pF | 6ms | (<i>eoscr</i> [6:5]=11, <i>misc.6</i> =0) |
| 1MHz | 10pF | 10pF | 11ms | (<i>eoscr</i> [6:5]=10, <i>misc.6</i> =0) |
| 32KHz | 22pF | 22pF | 450ms | (<i>eoscr</i> [6:5]=01, <i>misc.6</i> =0) |

Table 4: Recommend values of C1 and C2 for crystal and resonator oscillators

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

When using the crystal oscillator, user must pay attention to the stable time of oscillator after enabling it, the stable time of oscillator will depend on frequency “crystal type” external capacitor and supply voltage. Before switching the system to the crystal oscillator, user must make sure the oscillator is stable; the reference program is shown as below:

```
void  FPPA0 (void)
{
    .ADJUST_IC  SYSCLK=IHRC/16, IHRC=16MHz, VDD=5V
$    EOSCR      Enable, 4MHz;           // EOSCR = 0b111_00000;

$    T16M EOSC, /1, BIT13;              // T16 receive 2^14=16384 clocks of crystal EOSC,
                                         // Intrq.T16 =>1, crystal EOSC is stable

    WORD      count = 0;
    stt16 count;
    Intrq.T16  = 0;
    do
    {  nop; }while(!Intrq.T16);          // count from 0x0000 to 0x2000, then set INTRQ.T16
    clkmd=     0xB4;                    // switch system clock to EOSC;

    Clkmd.4 = 0;                        //disable IHRC
    ...
}
```

Please notice that the crystal oscillator should be fully turned off before entering the power-down mode, in order to avoid unexpected wakeup event.

5.4.5. System Clock and LVR level

The clock source of system clock comes from EOSC, IHRC and ILRC, the hardware diagram of system clock in the PMS133/PMS134 is shown as Fig.3.

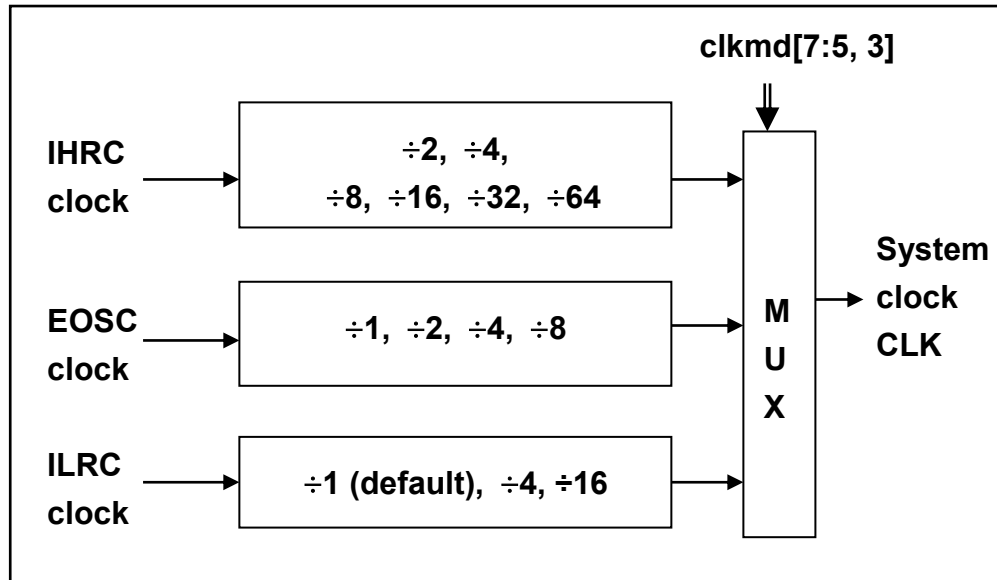

Fig.3: Options of System Clock

User can choose different operating system clock depends on its requirement; the selected operating system clock should be combined with supply voltage and LVR level to make system stable. The LVR level will be selected during compilation, and the lowest LVR levels can be chosen for different operating frequencies. Please refer to Section 4.1.

5.4.6. System Clock Switching

After IHRC calibration, user may want to switch system clock to a new frequency or may switch system clock at any time to optimize the system performance and power consumption. Basically, the system clock of PMS133/PMS134 can be switched among IHRC, ILRC and EOSC by setting the **clkmd** register at any time; system clock will be the new one after writing to **clkmd** register immediately. Please notice that the original clock module can NOT be turned off at the same time as writing command to **clkmd** register. The examples are shown as below and more information about clock switching, please refer to the “Help” -> “Application Note” -> “IC Introduction” -> “Register Introduction” -> CLKMD”.

Case 1: Switching system clock from ILRC to IHRC/2

```

...                                     // system clock is ILRC
CLKMD.4                               = 1; // turn on IHRC first to improve anti-interference ability
CLKMD                                  = 0x34 ; // switch to IHRC/2 · ILRC CAN NOT be disabled here
// CLKMD.2                             = 0 ; // if need, ILRC CAN be disabled at this time
...
  
```

Case 2: Switching system clock from ILRC to EOSC

```

...                                     //    system clock is ILRC
CLKMD          =    0xA6 ;           //    switch to IHRC , ILRC CAN NOT be disabled here
CLKMD.2        =    0 ;              //    ILRC CAN be disabled at this time
...

```

Case 3: Switching system clock from IHRC/2 to ILRC

```

...                                     //    system clock is IHRC/2
CLKMD          =    0xF4 ;           //    switch to ILRC , IHRC CAN NOT be disabled here
CLKMD.4        =    0 ;              //    IHRC CAN be disabled at this time
...

```

Case 4: Switching system clock from IHRC/2 to EOSC

```

...                                     //    system clock is IHRC/2
CLKMD          =    0xB0 ;           //    switch to EOSC , IHRC CAN NOT be disabled here
CLKMD.4        =    0 ;              //    IHRC CAN be disabled at this time
...

```

Case 5: Switching system clock from IHRC/2 to IHRC/4

```

...                                     //    system clock is IHRC/2, ILRC is enabled here
CLKMD          =    0X14 ;           //    switch to IHRC/4
...

```

Case 6: System may hang if it is to switch clock and turn off original oscillator at the same time

```

...                                     //    system clock is ILRC
CLKMD          =    0x30 ;           //    CAN NOT switch clock from ILRC to IHRC/2 and
                                     //    turn off ILRC oscillator at the same time
...

```

5.5. Comparator

One hardware comparator is built inside the PMS133/PMS134; Fig.4 shows its hardware diagram. It can compare signals between two pins or with either internal reference voltage $V_{\text{internal R}}$ or internal bandgap reference voltage. The two signals to be compared, one is the plus input and the other one is the minus input. For the minus input of comparator can be PA3, PA4, Internal bandgap 1.20 volt, PB6, PB7 or $V_{\text{internal R}}$ selected by bit [3:1] of gpcc register, and the plus input of comparator can be PA4 or $V_{\text{internal R}}$ selected by bit 0 of gpcc register.

The output result can be enabled to output to PA0 directly, or sampled by Time2 clock (TM2_CLK) which comes from Timer2 module. The output can be also inversed the polarity by bit 4 of **gpcc** register, the comparator output can be used to request interrupt service.

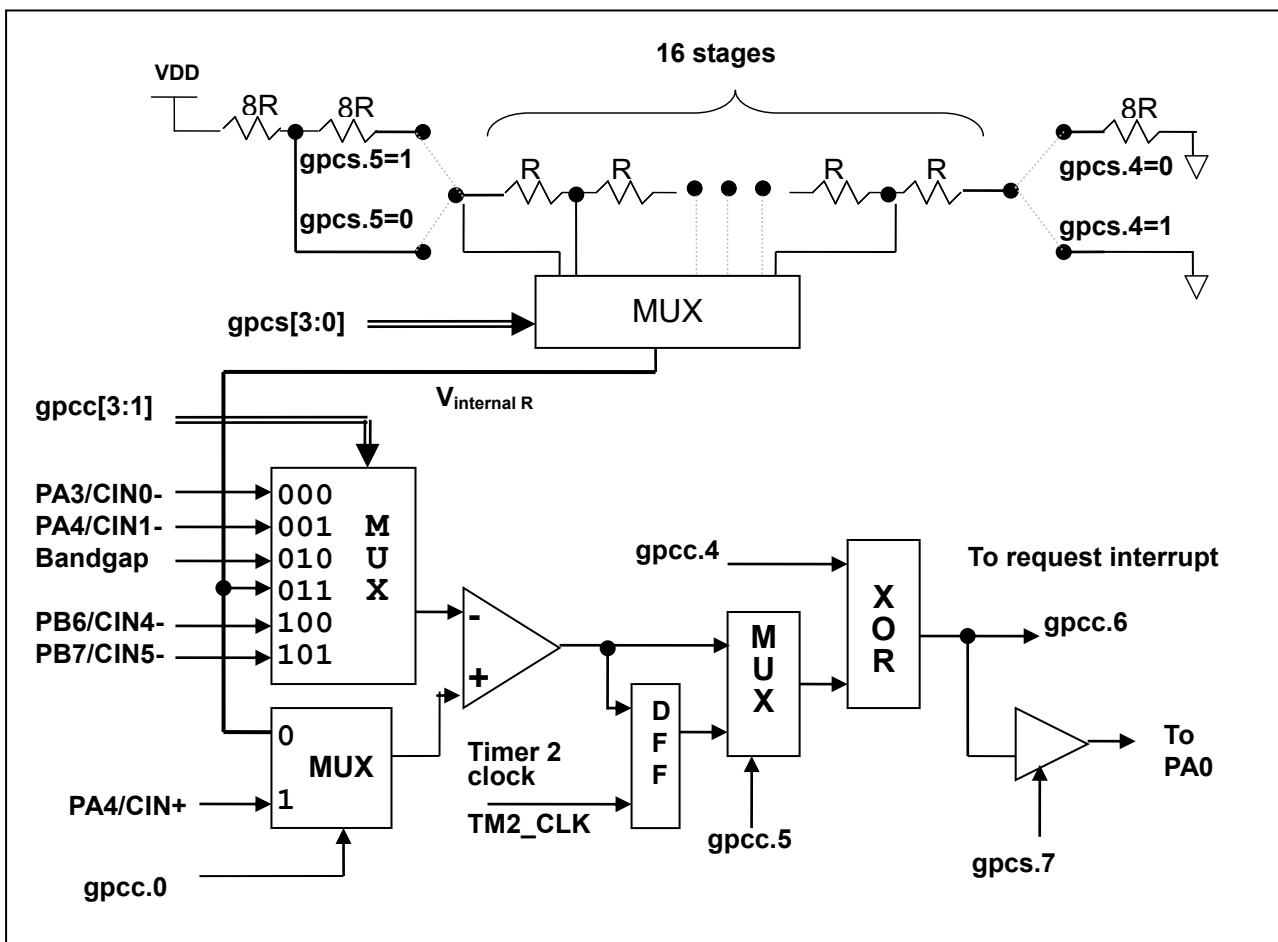

Fig.4: Hardware diagram of comparator

5.5.1 Internal reference voltage ($V_{\text{internal R}}$)

The internal reference voltage $V_{\text{internal R}}$ is built by series resistance to provide different level of reference voltage, bit 4 and bit 5 of **gpcs** register are used to select the maximum and minimum values of $V_{\text{internal R}}$ and bit [3:0] of **gpcs** register are used to select one of the voltage level which is divided-by-16 from the defined maximum level to minimum level. Fig.5 to Fig.8 shows four conditions to have different reference voltage $V_{\text{internal R}}$. By setting the **gpcs** register, the internal reference voltage $V_{\text{internal R}}$ can be ranged from $(1/32)*V_{\text{DD}}$ to $(3/4)*V_{\text{DD}}$.

Fig.5: $V_{\text{internal R}}$ hardware connection if gpcs.5=0 and gpcs.4=0

Fig.6: $V_{\text{internal R}}$ hardware connection if gpcs.5=0 and gpcs.4=1

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

Fig.7: $V_{\text{internal R}}$ hardware connection if gpcs.5=1 and gpcs.4=0

Fig.8: $V_{\text{internal R}}$ hardware connection if gpcs.5=1 and gpcs.4=1

5.5.2 Using the comparator

Case 1:

Choosing PA3 as minus input and $V_{internal\ R}$ with $(18/32)*V_{DD}$ voltage level as plus input. $V_{internal\ R}$ is configured as the above Figure “gpcs[5:4] = 2b'00” and gpcs [3:0] = 4b'1001 (n=9) to have $V_{internal\ R} = (1/4)*V_{DD} + [(9+1)/32]*V_{DD} = [(9+9)/32]*V_{DD} = (18/32)*V_{DD}$.

```
gpcs  = 0b0_0_00_1001;      //  $V_{internal\ R} = V_{DD}*(18/32)$ 
gpcc  = 0b1_0_0_0_000_0;    // enable comp, - input: PA3, + input:  $V_{internal\ R}$ 
padier = 0bxxxx_0_xxx;      // disable PA3 digital input to prevent leakage current
```

or

```
$ GPCS       $V_{DD}*18/32$ ;
$ GPCC      Enable, N_PA3, P_R;    // - input: N_xx, + input: P_R( $V_{internal\ R}$ )
PADIER = 0bxxxx_0_xxx;
```

Case 2:

Choosing $V_{internal\ R}$ as minus input with $(22/40)*V_{DD}$ voltage level and PA4 as plus input, the comparator result will be inversed and then output to PA0. $V_{internal\ R}$ is configured as the above Figure “gpcs[5:4] = 2b'10” and gpcs [3:0] = 4b'1101 (n=13) to have $V_{internal\ R} = (1/5)*V_{DD} + [(13+1)/40]*V_{DD} = [(13+9)/40]*V_{DD} = (22/40)*V_{DD}$.

```
gpcs  = 0b1_0_10_1101;      // output to PA0,  $V_{internal\ R} = V_{DD}*(22/40)$ 
gpcc  = 0b1_0_0_1_011_1;    // Inverse output, - input:  $V_{internal\ R}$ , + input: PA4
padier = 0bxxx_0_xxxx;      // disable PA4 digital input to prevent leakage current
```

or

```
$ GPCS       $V_{DD}*22/40$ ;
$ GPCC      Enable, Inverse, N_R, P_PA4;    // - input: N_R( $V_{internal\ R}$ ), + input: P_xx
PADIER = 0bxxx_0_xxxx;
```

Note: When selecting output to PA0 output, GPCS will affect the PA3 output function in ICE. Though the IC is fine, be careful to avoid this error during emulation.

5.5.3 Using the comparator and bandgap 1.20V

The internal bandgap module can provide 1.20 volt; it can measure the external supply voltage level. The bandgap 1.20 volt is selected as minus input of comparator and $V_{\text{internal R}}$ is selected as plus input, the supply voltage of $V_{\text{internal R}}$ is V_{DD} , the V_{DD} voltage level can be detected by adjusting the voltage level of $V_{\text{internal R}}$ to compare with bandgap. If N (gpcs[3:0] in decimal) is the number to let $V_{\text{internal R}}$ closest to bandgap 1.20 volt, the supply voltage V_{DD} can be calculated by using the following equations:

For using Case 1: $V_{\text{DD}} = [32 / (N+9)] * 1.20 \text{ volt} ;$

For using Case 2: $V_{\text{DD}} = [24 / (N+1)] * 1.20 \text{ volt} ;$

For using Case 3: $V_{\text{DD}} = [40 / (N+9)] * 1.20 \text{ volt} ;$

For using Case 4: $V_{\text{DD}} = [32 / (N+1)] * 1.20 \text{ volt} ;$

Case 1:

```

$ GPCS  $V_{\text{DD}} * 12 / 40$ ;           // 4.0V * 12/40 = 1.2V
$ GPCC Enable, BANDGAP, P_R;    // - input: BANDGAP, + input: P_R( $V_{\text{internal R}}$ )
....
if (GPC_Out)                     // or GPCC.6
{
    // when  $V_{\text{DD}} > 4V$ 
}
else
{
    // when  $V_{\text{DD}} < 4V$ 
}

```

5.6 VDD/2 LCD Bias Voltage Generator

This function can be enabled by misc.4 and code option LCD2. There are two sets of pins can be selected as the LCD COM ports, four pins in each set. By selecting PB0_A034 for LCD2, PB0, PA0, PA4 and PA3 are defined to output VDD/2 voltage during input mode, and be used as COM function for LCD applications. By selecting PB1256 of LCD2, PB1, PB2, PB5 and PB6 are defined as COM ports.

If user wants to output VDD, VDD/2, GND three levels voltage, enabling VDD/2 bias voltage (by set misc.4=1), then set to output-high for VDD, with input mode for VDD/2, and output-low for GND correspondingly, Fig.9 shows how to use this function.

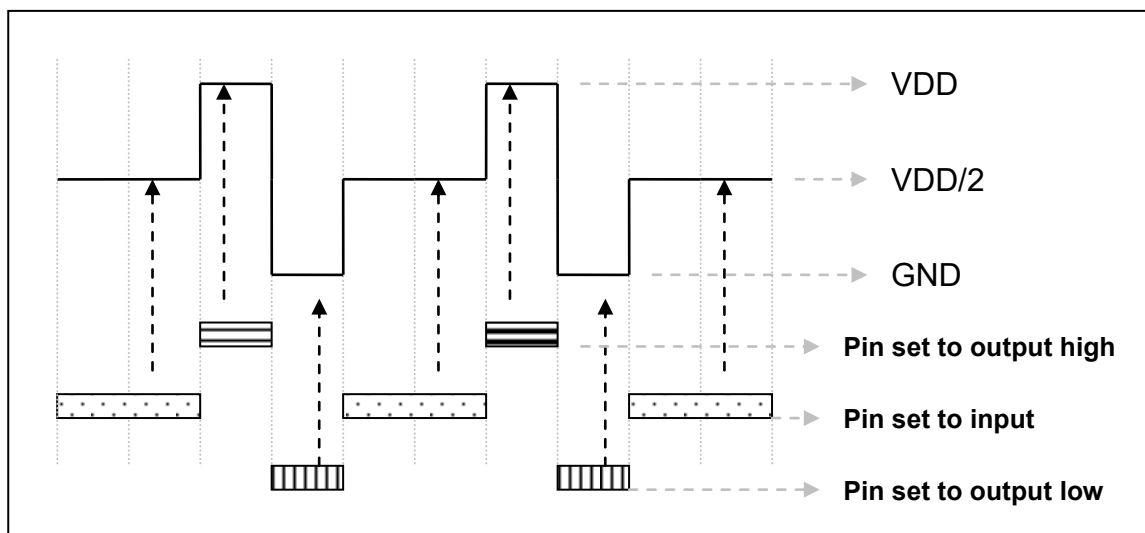

Fig. 9: Using VDD/2 LCD bias voltage generator

5.7 16-bit Timer (Timer16)

A 16-bit hardware timer (Timer16) is implemented in the PMS133/PMS134, the clock sources of Timer16 may come from system clock (CLK), clock of external crystal oscillator (EOSC), internal high RC oscillator (IHRC), internal low RC oscillator (ILRC), PA4 and PA0, a multiplex is used to select clock output for the clock source. Before sending clock to the counter16, a pre-scaling logic with divided-by-1, 4, 16, and 64 is used for wide range counting.

The 16-bit counter performs up-counting operation only, the counter initial values can be stored from memory by *stt16* instruction and the counting values can be loaded to memory by *ldt16* instruction. A selector is used to select the interrupt condition of Timer16, whenever overflow occurs, the Timer16 interrupt can be triggered. The hardware diagram of Timer16 is shown as Fig.10. The interrupt source of Timer16 comes from one of bit 8 to 15 of 16-bit counter, and the interrupt type can be rising edge trigger or falling edge trigger which is specified in the bit 5 of *intregs* register (IO address 0x0C).

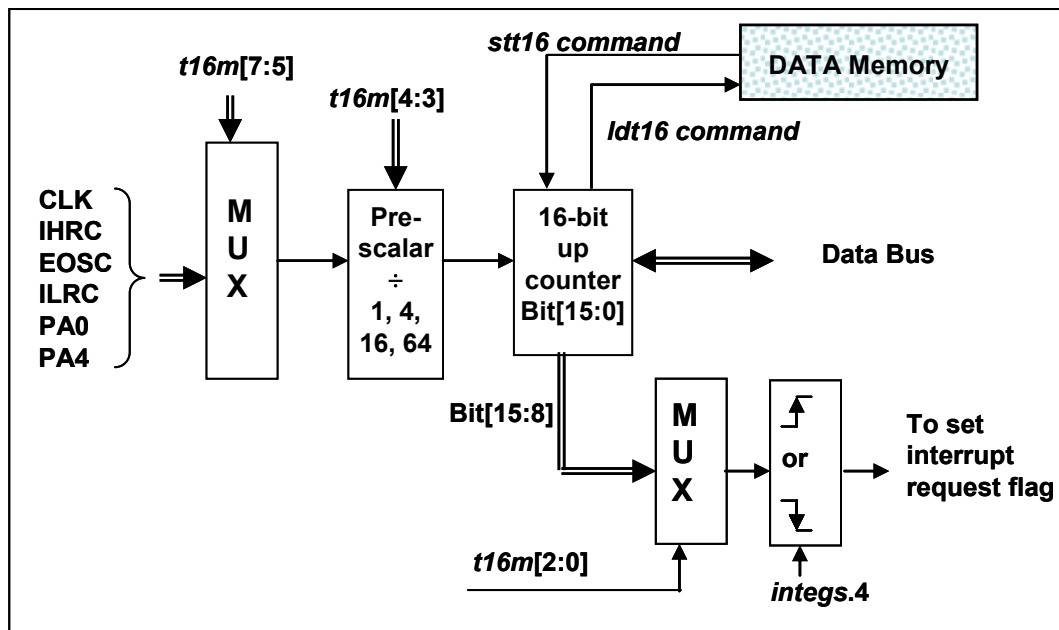

Fig.10: Hardware diagram of Timer16

When using the Timer16, the syntax for Timer16 has been defined in the .INC file. There are three parameters to define the Timer16; 1st parameter is used to define the clock source of Timer16, 2nd parameter is used to define the pre-scalar and the last one is to define the interrupt source. The detail description is shown as below:

```

T16M      IO_RW      0x06

$ 7~5: STOP, SYSCLK, X, PA4_F, IHRC, EOSC, ILRC, PA0_F    // 1st par.
$ 4~3: /1, /4, /16, /64                                   // 2nd par.
$ 2~0: BIT8, BIT9, BIT10, BIT11, BIT12, BIT13, BIT14, BIT15 // 3rd par.

```

User can define the parameters of T16M based on system requirement, some examples are shown below and more examples please refer to “Help → Application Note → IC Introduction → Register Introduction → T16M” in IDE utility.

\$ T16M SYSCLK, /64, BIT15;

// choose (SYSCLK/64) as clock source, every 2¹⁶ clock to set INTRQ.2=1
// if using System Clock = IHRC / 2 = 8 MHz
// SYSCLK/64 = 8 MHz/64 = 125KHz, about every 524 mS to generate INTRQ.2=1

\$ T16M EOSC, /1, BIT13;

// choose (EOSC/1) as clock source, every 2¹⁴ clocks to generate INTRQ.2=1
// if EOSC=32768 Hz, 32768 Hz/(2¹⁴) = 2Hz, every 0.5S to generate INTRQ.2=1

\$ T16M PA0_F, /1, BIT8;

// choose PA0 as clock source, every 2⁹ to generate INTRQ.2=1
// receiving every 512 times PA0 to generate INTRQ.2=1

\$ T16M STOP;

// stop Timer16 counting

If Timer16 is operated at free running, the frequency of interrupt can be described as below:

$$F_{INTRQ_T16M} = F_{\text{clock source}} \div P \div 2^{n+1}$$

Where, F is the frequency of selected clock source to Timer16;

P is the selection of t16m [4:3]; (1, 4, 16, 64)

N is the nth bit selected to request interrupt service, for example: n=10 if bit 10 is selected.

5.8 8-bit Timer (Timer2/Timer3) with PWM generation

Two 8-bit hardware timers (Timer2 and Timer3) with PWM generation are implemented in the PMS133/PMS134. The following descriptions thereafter are for Timer2 only. It is because Timer3 have same structure with Timer2. Please refer to Fig.11 shown the hardware diagram of Timer2, the clock sources of Timer2 may come from system clock, internal high RC oscillator (IHRC), internal low RC oscillator (ILRC), external crystal oscillator (EOSC), PA0, PB0, PA4 and comparator. Bit [7:4] of register tm2c are used to select the clock of Timer2. If IHRC is selected for Timer2 clock source, the clock sent to Timer2 will keep running when using ICE in halt state. The output of Timer2 can be sent to pin PB2, PA3 or PB4, depending on bit [3:2] of tm2c register. A clock pre-scaling module is provided with divided-by- 1, 4, 16, and 64 options, controlled by bit [6:5] of tm2s register; one scaling module with divided-by-1~32 is also provided and controlled by bit [4:0] of tm2s register. In conjunction of pre-scaling function and scaling function, the frequency of Timer2 clock (TM2_CLK) can be wide range and flexible.

The Timer2 counter performs 8-bit up-counting operation only; the counter values can be set or read back by tm2ct register. The 8-bit counter will be clear to zero automatically when its values reach for upper bound register, the upper bound register is used to define the period of timer or duty of PWM. There are two operating modes for Timer2: period mode and PWM mode; period mode is used to generate periodical output waveform or interrupt event; PWM mode is used to generate PWM output waveform with optional 6-bit to 8-bit PWM resolution, Fig.12 shows the timing diagram of Timer2 for both period mode and PWM mode.

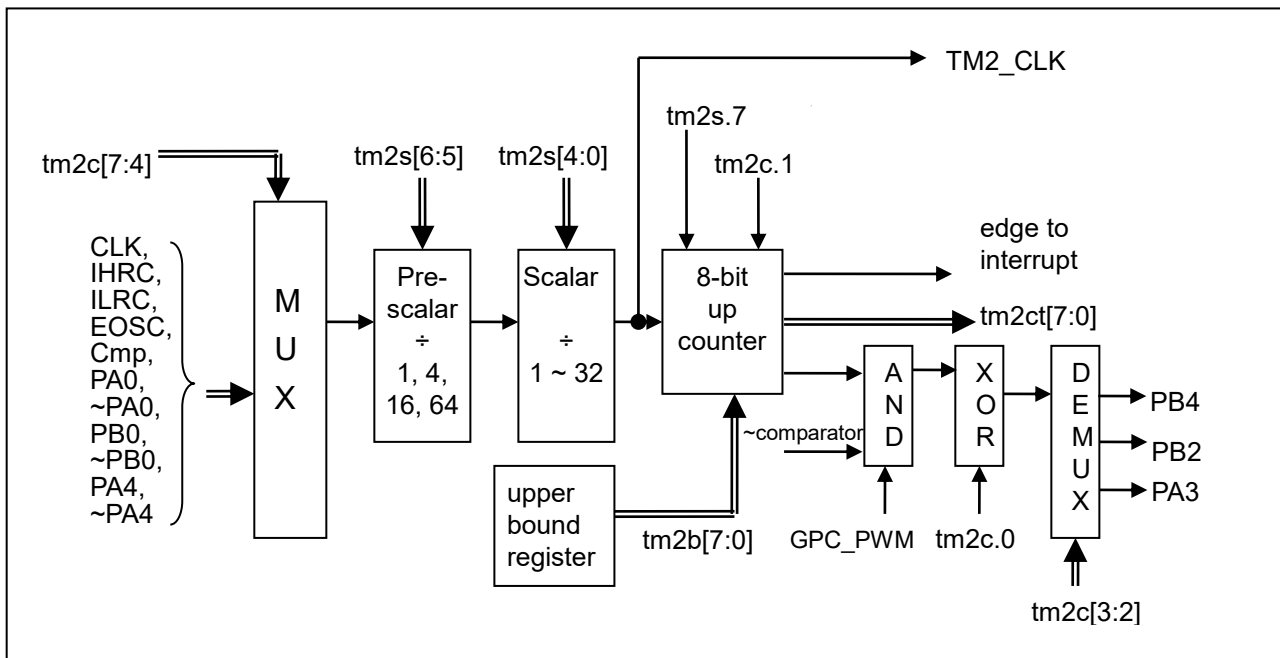

Fig.11: Timer2 hardware diagram

The output of Timer3 can be sent to pin PB5, PB6 or PB7.

Fig.12: Timing diagram of Timer2 in period mode and PWM mode (tm2c.1=1)

A Code Option GPC_PWM is for the applications which need the generated PWM waveform to be controlled by the comparator result. If the Code Option GPC_PWM is selected, the PWM output stops while the comparator output is 1 and then the PWM output turns on while the comparator output goes back to 0, as shown in Fig. 13.

Fig.13: Comparator controls the output of PWM waveform

5.8.1 Using the Timer2 to generate periodical waveform

If periodical mode is selected, the duty cycle of output is always 50%; its frequency can be summarized as below:

$$\text{Frequency of Output} = Y \div [2 \times (K+1) \times S1 \times (S2+1)]$$

Where,

- Y = tm2c[7:4] : frequency of selected clock source
- K = tm2b[7:0] : bound register in decimal
- S1 = tm2s[6:5] : pre-scalar (S1= 1, 4, 16, 64)
- S2 = tm2s[4:0] : scalar register in decimal (S2= 0 ~ 31)

Example 1:

tm2c = 0b0001_1000, Y=8MHz

tm2b = 0b0111_1111, K=127

tm2s = 0b0000_00000, S1=1, S2=0

➔ Frequency of output = $8\text{MHz} \div [2 \times (127+1) \times 1 \times (0+1)] = 31.25\text{KHz}$

Example 2:

tm2c = 0b0001_1000, Y=8MHz

tm2b = 0b0111_1111, K=127

tm2s[7:0] = 0b0111_1111, S1=64, S2 = 31

➔ Frequency = $8\text{MHz} \div (2 \times (127+1) \times 64 \times (31+1)) = 15.25\text{Hz}$

Example 3:

tm2c = 0b0001_1000, Y=8MHz

tm2b = 0b0000_1111, K=15

tm2s = 0b0000_00000, S1=1, S2=0

➔ Frequency = $8\text{MHz} \div (2 \times (15+1) \times 1 \times (0+1)) = 250\text{KHz}$

Example 4:

tm2c = 0b0001_1000, Y=8MHz

tm2b = 0b0000_0001, K=1

tm2s = 0b0000_00000, S1=1, S2=0

➔ Frequency = $8\text{MHz} \div (2 \times (1+1) \times 1 \times (0+1)) = 2\text{MHz}$

The sample program for using the Timer2 to generate periodical waveform from PA3 is shown as below:

Void FPPA0 (void)

```
{
    . ADJUST_IC    SYSCLK=IHRC/2, IHRC=16MHz, VDD=5V
    ...
    tm2ct = 0x0;
    tm2b = 0x7f;
    tm2s = 0b0_00_00001;           //      8-bit PWM, pre-scalar = 1, scalar = 2
    tm2c = 0b0001_10_0_0;         //      system clock, output=PA3, period mode
    while(1)
    {
        nop;
    }
}
```

5.8.2 Using the Timer2 to generate 8-bit PWM waveform

If 8-bit PWM mode is selected, it should set **tm2c[1]=1** and **tm2s[7]=0**, the frequency and duty cycle of output waveform can be summarized as below:

$$\text{Frequency of Output} = Y \div [256 \times S1 \times (S2+1)]$$

$$\text{Duty of Output} = [(K+1) \div 256] \times 100\%$$

Where,

- Y = tm2c[7:4] : frequency of selected clock source
- K = tm2b[7:0] : bound register in decimal
- S1= tm2s[6:5] : pre-scalar (S1= 1, 4, 16, 64)
- S2 = tm2s[4:0] : scalar register in decimal (S2= 0 ~ 31)

Example 1:

tm2c = 0b0001_1010, Y=8MHz
 tm2b = 0b0111_1111, K=127
 tm2s = 0b0000_00000, S1=1, S2=0
 → frequency of output = $8\text{MHz} \div (256 \times 1 \times (0+1)) = 31.25\text{KHz}$
 → duty of output = $[(127+1) \div 256] \times 100\% = 50\%$

Example 2:

tm2c = 0b0001_1010, Y=8MHz
 tm2b = 0b0111_1111, K=127
 tm2s = 0b0111_11111, S1=64, S2=31
 → frequency of output = $8\text{MHz} \div (256 \times 64 \times (31+1)) = 15.25\text{Hz}$
 → duty of output = $[(127+1) \div 256] \times 100\% = 50\%$

Example 3:

tm2c = 0b0001_1010, Y=8MHz
 tm2b = 0b1111_1111, K=255
 tm2s = 0b0000_00000, S1=1, S2=0
 → PWM output keep high
 → duty of output = $[(255+1) \div 256] \times 100\% = 100\%$

Example 4:

tm2c = 0b0001_1010, Y=8MHz
 tm2b = 0b0000_1001, K = 9
 tm2s = 0b0000_00000, S1=1, S2=0
 → frequency of output = $8\text{MHz} \div (256 \times 1 \times (0+1)) = 31.25\text{KHz}$
 → duty of output = $[(9+1) \div 256] \times 100\% = 3.9\%$

The sample program for using the Timer2 to generate PWM waveform from PA3 is shown as below:

```
void FPPA0(void)
{
    .ADJUST_IC    SYSCLK=IHRC/2, IHRC=16MHz, VDD=5V
    tm2ct = 0x0;
    tm2b = 0x7f;
    tm2s = 0b0_00_00001;           // 8-bit PWM, pre-scalar = 1, scalar = 2
    tm2c = 0b0001_10_1_0;         // system clock, output=PA3, PWM mode
    while(1)
    {
        nop;
    }
}
```

5.8.3 Using the Timer2 to generate 6-bit PWM waveform

If 6-bit PWM mode is selected, it should set **tm2c**[1]=1 and **tm2s**[7]=1, the frequency and duty cycle of output waveform can be summarized as below:

$$\text{Frequency of Output} = Y \div [64 \times S1 \times (S2+1)]$$

$$\text{Duty of Output} = [(K + 1) \div 64] \times 100\%$$

Where,

- tm2c[7:4] = Y : frequency of selected clock source
- tm2b[7:0] = K : bound register in decimal
- tm2s[6:5] = S1 : pre-scalar (1, 4, 16, 64)
- tm2s[4:0] = S2 : scalar register in decimal (1 ~ 31)

Users can set Timer2 to be 7-bit PWM mode instead of 6-bit mode by using **TMx_Bit** code option. At that time, the calculation factors of the above equations become 128 instead of 64.

Example 1:

```
tm2c = 0b0001_1010, Y=8MHz
tm2b = 0b0001_1111, K=31
tm2s = 0b1000_00000, S1=1, S2=0
➔ frequency of output = 8MHz ÷ ( 64 × 1 × (0+1) ) = 125KHz
➔ duty = [(31+1) ÷ 64] × 100% = 50%
```

Example 2:

```
tm2c = 0b0001_1010, Y=8MHz
tm2b = 0b0001_1111, K=31
tm2s = 0b1111_11111, S1=64, S2=31
➔ frequency of output = 8MHz ÷ ( 64 × 64 × (31+1) ) = 61.03 Hz
➔ duty of output = [(31+1) ÷ 64] × 100% = 50%
```

Example 3:

$tm2c = 0b0001_1010$, $Y=8MHz$
 $tm2b = 0b0011_1111$, $K=63$
 $tm2s = 0b1000_00000$, $S1=1$, $S2=0$
 → PWM output keep high
 → duty of output = $[(63+1) \div 64] \times 100\% = 100\%$

Example 4:

$tm2c = 0b0001_1010$, $Y=8MHz$
 $tm2b = 0b0000_0000$, $K=0$
 $tm2s = 0b1000_00000$, $S1=1$, $S2=0$
 → frequency = $8MHz \div (64 \times 1 \times (0+1)) = 125KHz$
 → duty = $[(0+1) \div 64] \times 100\% = 1.5\%$

5.9 11-bit PWM Generator

Three 11-bit hardware PWM generators (PWMG0, PWMG1 & PWMG2) are implemented in the PMS133/PMS134. The following descriptions thereafter are for PWMG0 only. It is because PWMG1 & PWMG2 have the same structures and functions with PWMG0.

Their individual outputs are listed as below:

- PWMG0 – PA0, PB4, PB5, PC2
- PWMG1 – PA4, PB6, PB7, PC3
- PWMG2 – PA3, PB2, PB3, PC0

5.9.1 PWM Waveform

A PWM output waveform (Fig.13) has a time-base (T_{Period} = Time of Period) and a time with output high level (Duty Cycle). The frequency of the PWM output is the inverse of the period ($f_{PWM} = 1/T_{Period}$).

Fig.14: PWM Output Waveform

5.9.2 Hardware and Timing Diagram

Three 11-bit hardware PWM generators are built inside the PMS133/PMS134; Fig.14 shows the hardware diagram PWMG0 as an example. The clock source can be IHRC or system clock and output pin can be selected via ***pwmc*** register selection. The period of PWM waveform is defined in the PWM upper bond high and low registers, the duty cycle of PWM waveform is defined in the PWM duty high and low registers. Comparator output can control the PWM waveform by selecting GPC_PWM code option.

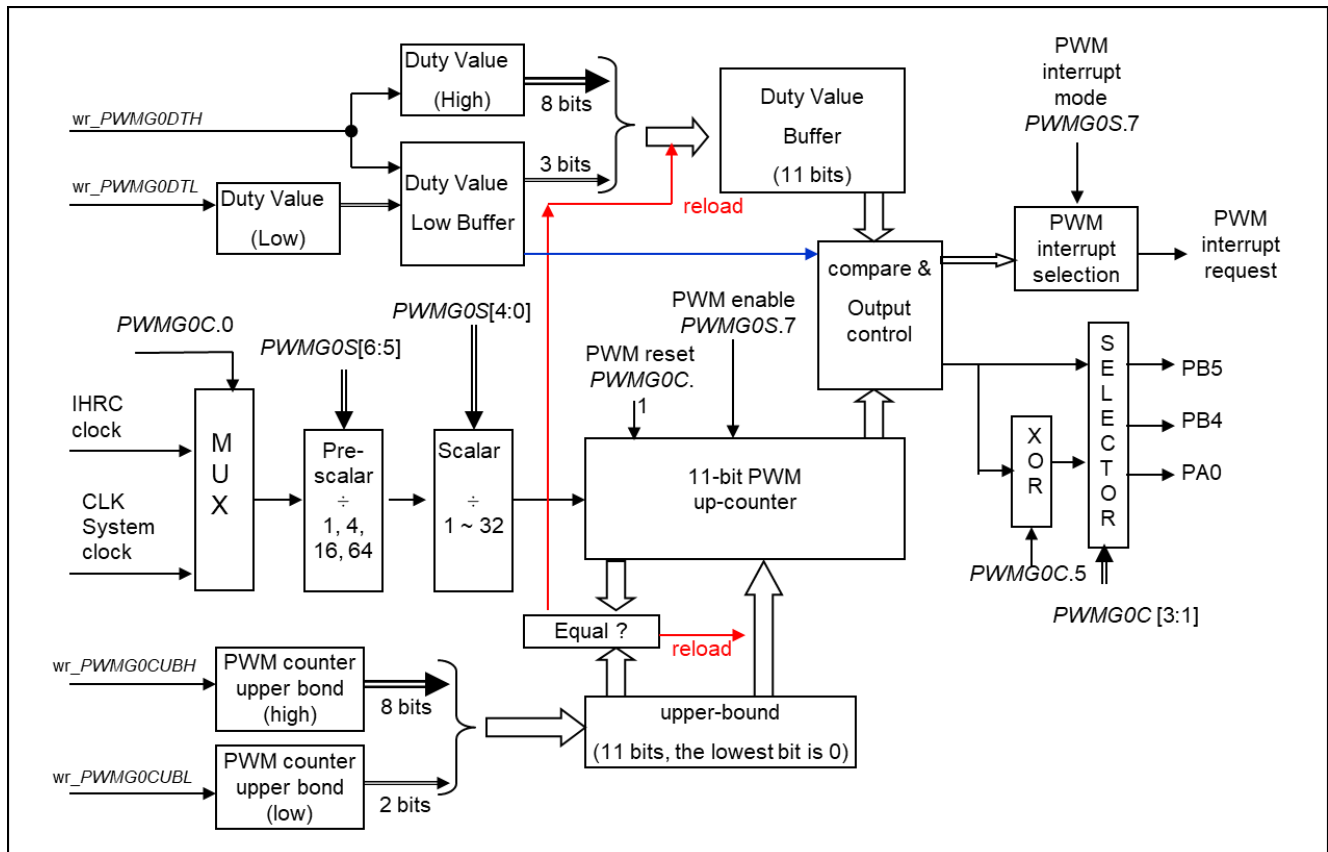

Fig.15: Hardware Diagram of 11-bit PWM Generator

Fig.16: Output Timing Diagram of 11-bit PWM Generator

5.9.3 Equations for 11-bit PWM Generator

$$\text{PWM Frequency } F_{\text{PWM}} = F_{\text{clock source}} \div [P \times (K + 1) \times (CB10_1 + 1)]$$

$$\text{PWM Duty (in time)} = (1 / F_{\text{PWM}}) \times (DB10_1 + DB0 \times 0.5 + 0.5) \div (CB10_1 + 1)$$

$$\text{PWM Duty (in percentage)} = (DB10_1 + DB0 \times 0.5 + 0.5) \div (CB10_1 + 1) \times 100\%$$

Where, **P** = *PWMGxS* [6:5] : pre-scalar (**P** = 1, 4, 16, 64)

K = *PWMGxS* [4:0] : scalar in decimal (**K** = 0 ~ 31)

DB10_1 = Duty_Bound[10:1] = {*PWMGxDTH*[7:0], *PWMGxDTL*[7:6]}, duty bound

DB0 = Duty_Bound[0] = *PWMGxDTL*[5]

CB10_1 = Counter_Bound[10:1] = {*PWMGxCUBH*[7:0], *PWMGxCUBL*[7:6]}, counter bound

5.10 Watchdog Timer

The watchdog timer (WDT) is a counter with clock coming from ILRC. WDT can be cleared by power-on-reset or by command **wdreset** at any time. There are four different timeout periods of watchdog timer to be chosen by setting the **misc** register, it is:

- ◆ 8k ILRC clocks period if register *misc*[1:0]=00 (default)
- ◆ 16k ILRC clocks period if register *misc*[1:0]=01
- ◆ 64k ILRC clocks period if register *misc*[1:0]=10
- ◆ 256k ILRC clocks period if register *misc*[1:0]=11

The frequency of ILRC may drift a lot due to the variation of manufacture, supply voltage and temperature; user should reserve guard band for save operation. Besides, the watchdog period will also be shorter than expected after Reset or Wakeup events. It is suggested to clear WDT by **wdreset** command after these events to ensure enough clock periods before WDT timeout.

When WDT is timeout, PMS133/PMS134 will be reset to restart the program execution. The relative timing diagram of watchdog timer is shown as Fig.16.

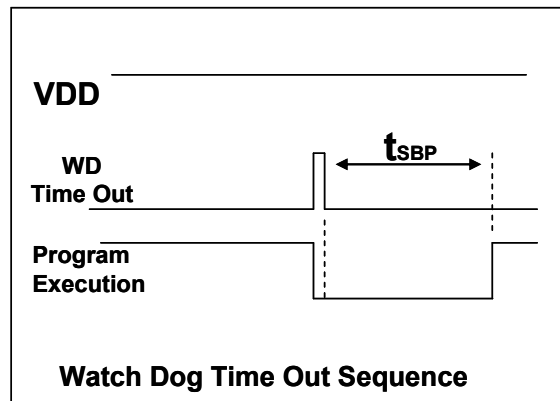

Fig.17: Sequence of Watch Dog Time Out

5.11 Interrupt

There are eight interrupt lines for PMS133/PMS134:

- ◆ External interrupt PA0/PB5/PA2/PA7
- ◆ GPC interrupt
- ◆ External interrupt PB0/PA4/PB6/PA3
- ◆ PWMG0 interrupt
- ◆ ADC interrupt
- ◆ Timer2 interrupt
- ◆ Timer16 interrupt
- ◆ Timer3 interrupt

Every interrupt request line has its own corresponding interrupt control bit to enable or disable it; the hardware diagram of interrupt function is shown as Fig. 17. All the interrupt request flags are set by hardware and cleared by writing *intrq* register. When the request flags are set, it can be rising edge, falling edge or both, depending on the setting of register *integs*. All the interrupt request lines are also controlled by *engint* instruction (enable global interrupt) to enable interrupt operation and *disgint* instruction (disable global interrupt) to disable it.

The stack memory for interrupt is shared with data memory and its address is specified by stack register *sp*. Since the program counter is 16 bits width, the bit 0 of stack register *sp* should be kept 0. Moreover, user can use *pushaf* / *popaf* instructions to store or restore the values of *ACC* and *flag* register *to* / *from* stack memory. Since the stack memory is shared with data memory, the stack position and level are arranged by the compiler in Mini-C project. When defining the stack level in ASM project, users should arrange their locations carefully to prevent address conflicts.

Note: the external interrupt source can be switched through Interrupt Src0 or Interrupt Src1 in the Code Option.

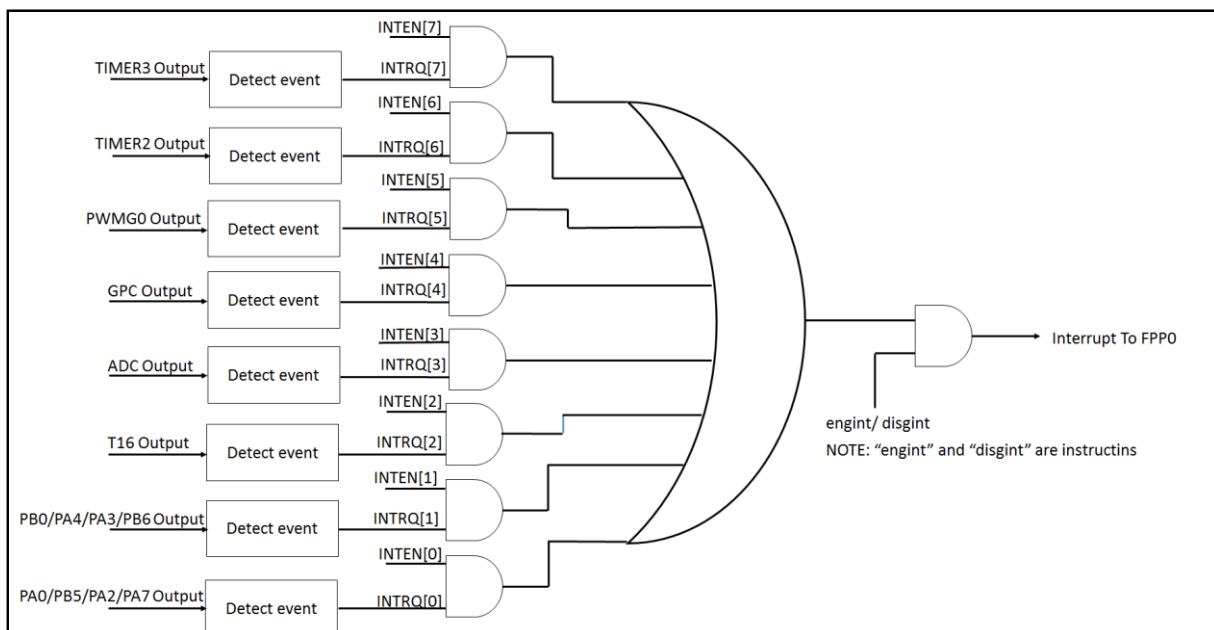

Fig.18: Hardware diagram of interrupt controller

Once the interrupt occurs, its operation will be:

- ◆ The program counter will be stored automatically to the stack memory specified by register *sp*.
- ◆ New *sp* will be updated to *sp+2*.
- ◆ Global interrupt will be disabled automatically.
- ◆ The next instruction will be fetched from address 0x010.

During the interrupt service routine, the interrupt source can be determined by reading the *intrq* register.

Note: Even if INTEN=0, INTRQ will be still triggered by the interrupt source.

After finishing the interrupt service routine and issuing the *reti* instruction to return back, its operation will be:

- ◆ The program counter will be restored automatically from the stack memory specified by register *sp*.
- ◆ New *sp* will be updated to *sp-2*.
- ◆ Global interrupt will be enabled automatically.

The next instruction will be the original one before interrupt.

User must reserve enough stack memory for interrupt, two bytes stack memory for one level interrupt and four bytes for two levels interrupt. For interrupt operation, the following sample program shows how to handle the interrupt, noticing that it needs four bytes stack memory to handle interrupt and *pushaf*.

```

void      FPPA0      (void)
{
    ...
    $ INTEN  PA0;      // INTEN =1; interrupt request when PA0 level changed
    INTRQ  = 0;        // clear INTRQ
    ENGINT                    // global interrupt enable
    ...
    DISGINT                // global interrupt disable
    ...
}

void      Interrupt  (void)      // interrupt service routine
{
    PUSHAF                    // store ALU and FLAG register

    // If INTEN.PA0 will be opened and closed dynamically,
    // user can judge whether INTEN.PA0 =1 or not.
    // Example: If (INTEN.PA0 && INTRQ.PA0) {...}

    // If INTEN.PA0 is always enable,
    // user can omit the INTEN.PA0 judgement to speed up interrupt service routine.

    If (INTRQ.PA0)
    {
        // Here for PA0 interrupt service routine
        INTRQ.PA0 = 0;    // Delete corresponding bit (take PA0 for example)
        ...
    }
    ...
    // X : INTRQ = 0;      // It is not recommended to use INTRQ = 0 to clear all at the end of the
                          // interrupt service routine.
                          // It may accidentally clear out the interrupts that have just occurred
                          // and are not yet processed.

    POPAF                    // restore ALU and FLAG register
}

```

5.12 Power-Save and Power-Down

There are three operational modes defined by hardware: ON mode, Power-Save mode and Power-Down modes. ON mode is the state of normal operation with all functions ON, Power-Save mode (“**stopexe**”) is the state to reduce operating current and CPU keeps ready to continue, Power-Down mode (“**stopsys**”) is used to save power deeply. Therefore, Power-Save mode is used in the system which needs low operating power with wake-up occasionally and Power-Down mode is used in the system which needs power down deeply with seldom wake-up. Table 5 shows the differences in oscillator modules between Power-Save mode (“**stopexe**”) and Power-Down mode (“**stopsys**”).

| Differences in oscillator modules between STOPSYS and STOPEXE | | | |
|---|-----------|-----------|-----------|
| | IHRC | ILRC | EOSC |
| STOPSYS | Stop | Stop | Stop |
| STOPEXE | No Change | No Change | No Change |

Table 5: Differences in oscillator modules between STOPSYS and STOPEXE

5.12.1 Power-Save mode (“**stopexe**”)

Using “**stopexe**” instruction to enter the Power-Save mode, only system clock is disabled, remaining all the oscillator modules active. For CPU, it stops executing; however, for Timer16, counter keep counting if its clock source is not the system clock. The wake-up sources for “**stopexe**” can be IO-toggle or Timer16 counts to set values when the clock source of Timer16 is IHRC or ILRC modules, or wakeup by comparator when setting *GPCC.7*=1 and *GPCS.6*=1 to enable the comparator wakeup function at the same time. Wake-up from input pins can be considered as a continuation of normal execution, the detail information for Power-Save mode shows below:

- IHRC and EOSC oscillator modules: No change, keep active if it was enabled
- ILRC oscillator modules: must remain enabled, need to start with ILRC when be wakening up
- System clock: Disable, therefore, CPU stops execution
- OTP memory is turned off
- Timer counter: Stop counting if its clock source is system clock or the corresponding oscillator module is disabled; otherwise, it keeps counting. (The Timer contains TM16, TM2, TM3, PWMG0, PWMG1, PWMG2.)
- Wake-up sources:
 - a. IO toggle wake-up: IO toggling in digital input mode (*PxC* bit is 1 and *PxDIER* bit is 1).
 - b. Timer wake-up: If the clock source of Timer is not the SYSClk, the system will be awakened when the Timer counter reaches the set value, it is awakened on both the rising and falling edges.
 - c. Comparator wake-up: It need setting *GPCC.7*=1 and *GPCS.6*=1 to enable the comparator wake-up function at the same time. Please note: the internal 1.20V bandgap reference voltage is not suitable for the comparator wake-up function.

An example shows how to use Timer16 to wake-up from “**stopexe**”:

```

$ T16M      ILRC, /1, BIT8           // Timer16 setting
...
WORD      count =      0;
STT16     count;
stopexe;
...

```

The initial counting value of Timer16 is zero and the system will be woken up after the Timer16 counts 256 ILRC clocks.

5.12.2 Power-Down mode (“*stopsys*”)

Power-Down mode is the state of deeply power-saving with turning off all the oscillator modules. By using the “*stopsys*” instruction, this chip will be put on Power-Down mode directly. It is recommending to set GPCC.7=0 to disable the comparator before the command “*stopsys*”. The following shows the internal status of PMS133/PMS134 detail when “*stopsys*” command is issued:

- All the oscillator modules are turned off.
- OTP memory is turned off.
- The contents of SRAM and registers remain unchanged.
- Wake-up sources: IO toggle in digital mode (PxDIER bit is 1)

Wake-up from input pins can be considered as a continuation of normal execution. To minimize power consumption, all the I/O pins should be carefully manipulated before entering power-down mode. The reference sample program for power down is shown as below:

```

CLKMD      =    0xF4;      //    Change clock from IHRC to ILRC
CLKMD.4    =    0;         //    disable IHRC
...
while (1)
{
    STOPSYS;           //    enter power-down
    if (...) break;    //    if wakeup happen and check OK, then return to high speed,
                        //    else stay in power-down mode again.
}
CLKMD =    0x34;       //    Change clock from ILRC to IHRC/2

```

5.12.3 Wake-up

After entering the Power-Down or Power-Save modes, the PMS133/PMS134 can be resumed to normal operation by toggling IO pins, Timer interrupt is available for Power-Save mode ONLY. Table 6 shows the differences in wake-up sources between STOPSYS and STOPEXE.

| Differences in wake-up sources between STOPSYS and STOPEXE | | | |
|--|-----------|-----------------|--------------------|
| | IO Toggle | Timer Interrupt | Comparator wake-up |
| STOPSYS | Yes | No | No |
| STOPEXE | Yes | Yes | Yes |

Table 6: Differences in wake-up sources between Power-Save mode and Power-Down mode

When using the IO pins to wake-up the PMS133/PMS134, registers **padier** should be properly set to enable the wake-up function for every corresponding pin. The time for normal wake-up is about 3000 ILRC clocks counting from wake-up event; fast wake-up can be selected to reduce the wake-up time by **misc** register, and the time for fast wake-up is about 45 ILRC clocks from IO toggling.

| Suspend mode | Wake-up mode | Wake-up time (t_{WUP}) from IO toggle |
|--|----------------|---|
| STOPEXE suspend or STOPSYS suspend | Fast wake-up | $45 * T_{ILRC}$, Where T_{ILRC} is the time period of ILRC |
| STOPEXE suspend or STOPSYS suspend | Normal wake-up | $3000 * T_{ILRC}$, Where T_{ILRC} is the clock period of ILRC |

Please notice that when Fast boot-up is selected, no matter which wake-up mode is selected in **misc.5**, the wake-up mode will be forced to be FAST. If Normal boot-up is selected, the wake-up mode is determined by **misc.5**.

5.13 IO Pins

All the pins can be independently set into two states output or input by configuring the data registers (**pa**, **pb**, **pc**), control registers (**pac**, **pbc**, **pcc**) and pull-high registers (**paph**, **pbph**, **pcph**). All these pins have Schmitt-trigger input buffer and output driver with CMOS level. When it is set to output low, the pull-high resistor is turned off automatically. If user wants to read the pin state, please notice that it should be set to input mode before reading the data port; if user reads the data port when it is set to output mode, the reading data comes from data register, NOT from IO pad. As an example, Table 7 shows the configuration table of bit 0 of port A. The hardware diagram of IO buffer is also shown as Fig.18.

| pa.0 | pac.0 | paph.0 | Description |
|-------------|--------------|---------------|--|
| X | 0 | 0 | Input without pull-high resistor |
| X | 0 | 1 | Input with pull-high resistor |
| 0 | 1 | X | Output low without pull-high resistor |
| 1 | 1 | 0 | Output high without pull-high resistor |
| 1 | 1 | 1 | Output high with pull-high resistor |

Table 7: PA0 Configuration Table

Fig. 19: Hardware diagram of IO buffer

PB4 and PB7 can adjust their drive and sink current by code option **PB4_PB7_Drive**

Other than PA5, all the IO pins have the same structure; PA5 can be open-drain ONLY when setting to output mode (without Q1). The corresponding bits in registers **padier** / **pbdier** / **pcdier** should be set to low to prevent leakage current for those pins are selected to be analog function. When PMS133/PMS134 is put in power-down or power-save mode, every pin can be used to wake-up system by toggling its state. Therefore, those pins needed to wake-up system must be set to input mode and set the corresponding bits of registers **pxdier** to high. The same reason, **padier.0** should be set high when PA0 is used as external interrupt pin, and so for other external interrupt pins: PB0, PA4, PB5, PB6, PA2, PA3 and PA7.

5.14 Reset and LVR

5.14.1 Reset

There are many causes to reset the PMS133/PMS134, once reset is asserted, most of all the registers in PMS133/PMS134 will be set to default values, system should be restarted once abnormal cases happen, or by jumping program counter to address 0x00.

After a power-on reset or LVR reset occurs, if VDD is greater than VDR (data storage voltage), the value of the data memory will be retained, but if the SRAM is cleared after re-power, the data cannot be retained; if VDD is less than VDR, the data the value of the memory will be turned into an unknown state that is in an indeterminate state.

If a reset occurs, and there is an instruction or syntax to clear SRAM in the program, the previous data will be cleared during program initialization and cannot be retained.

The content will be kept when reset comes from PRSTB pin or WDT timeout.

5.14.2 LVR reset

By code option, there are many different levels of LVR for reset. Usually, user selects LVR reset level to be in conjunction with operating frequency and supply voltage.

5.15 Analog-to-Digital Conversion (ADC) module

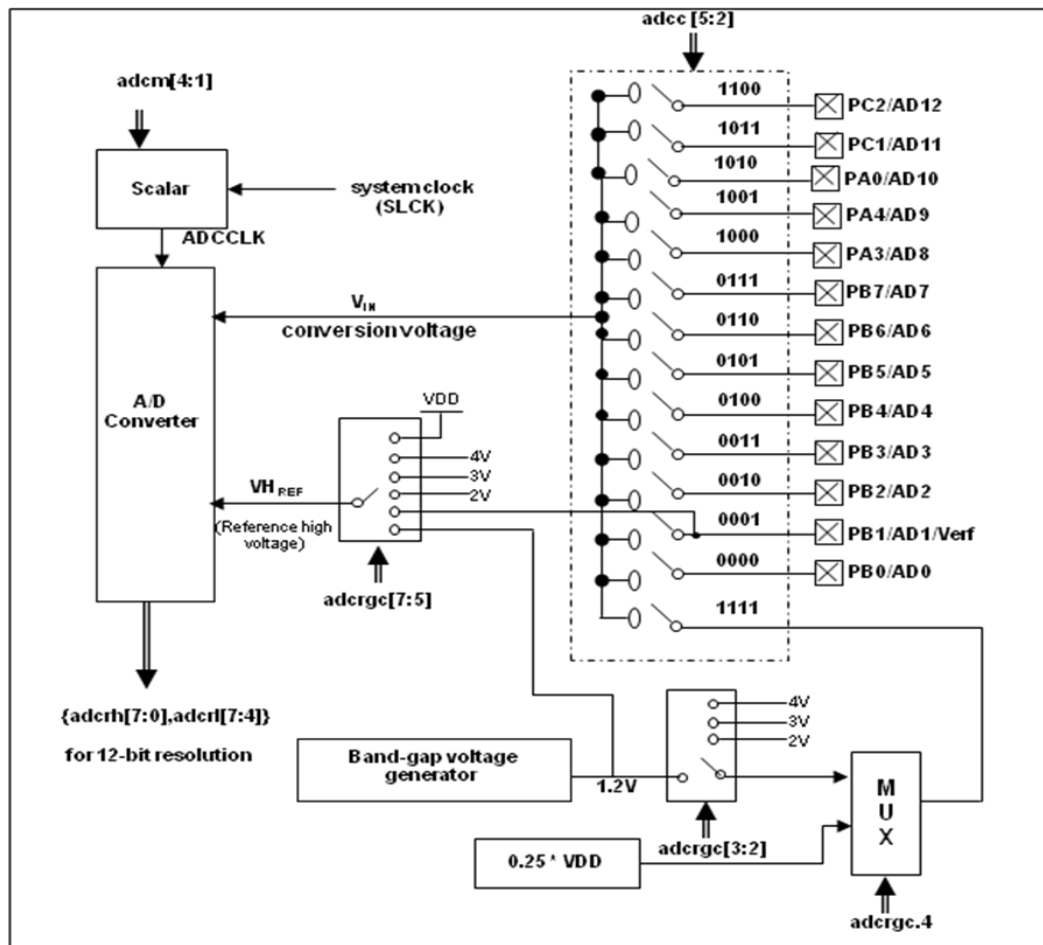

Fig.20: ADC Block Diagram

There are seven registers when using the ADC module, which are:

- ◆ ADC Control Register (**adcc**)
- ◆ ADC Regulator Control Register (**adcrge**)
- ◆ ADC Mode Register (**adcm**)
- ◆ ADC Result High/Low Register (**adcrh**, **adctl**)
- ◆ Port A/B/C Digital Input Enable Register (**padier**, **pbdier**, **pcdier**)

The following steps are required to do the ADC conversion procedure:

- (1) Configure the voltage reference high by **adcrge** register
- (2) Configure the AD conversion clock by **adcm** register
- (3) Configure the pin as analog input by **padier**, **pbdier** register
- (4) Select the ADC input channel by **adcc** register

- (5) Enable the ADC module by **adcc** register
- (6) Delay a certain amount of time after enabling the ADC module

Condition1: Using bandgap 1.2V or 2V/3V/4V related circuit, either it is used as an internal reference high voltage or an AD Input channel, it must delay more than 1ms. Or it must delay 200 AD clocks when the time of 200 AD clocks is larger than 1ms. When internal BG/2V/3V/4V is enabled as reference high voltage, IHRC must be opened.

Condition 2: Without using any bandgap 1.2V or 2V/3V/4V related circuit, it needs to delay 200 AD clocks only.

Note: The 200 AD clocks in the above two conditions, which refer to the ADC conversion clock rather than the system clock (SYSCLK) after configured by the ADCM register.

- (7) Execute the AD conversion and check if ADC data is ready
Set '1' to addc.6 to start the conversion and check whether addc.6 is '1'
- (8) Read the ADC result registers:
First read the adcrh register and then read the adcll register.

If user power down the ADC and enable the ADC again, or switch ADC reference voltage and input channel, be sure to go to step 6 to confirm the ADC becomes ready before the conversion.

5.15.1 The input requirement for AD conversion

For the AD conversion to meet its specified accuracy, the charge holding capacitor (C_{HOLD}) must be allowed to fully charge to the voltage reference high level and discharge to the voltage reference low level. The analog input model is shown as Fig.20, the signal driving source impedance (R_s) and the internal sampling switch impedance (R_{ss}) will affect the required time to charge the capacitor C_{HOLD} directly. The internal sampling switch impedance may vary with ADC supply voltage; the signal driving source impedance will affect accuracy of analog input signal. User must ensure the measured signal is stable before sampling; therefore, the maximum signal driving source impedance is highly dependent on the frequency of signal to be measured. The recommended maximum impedance for analog driving source is about 10K Ω under 500KHz input frequency.

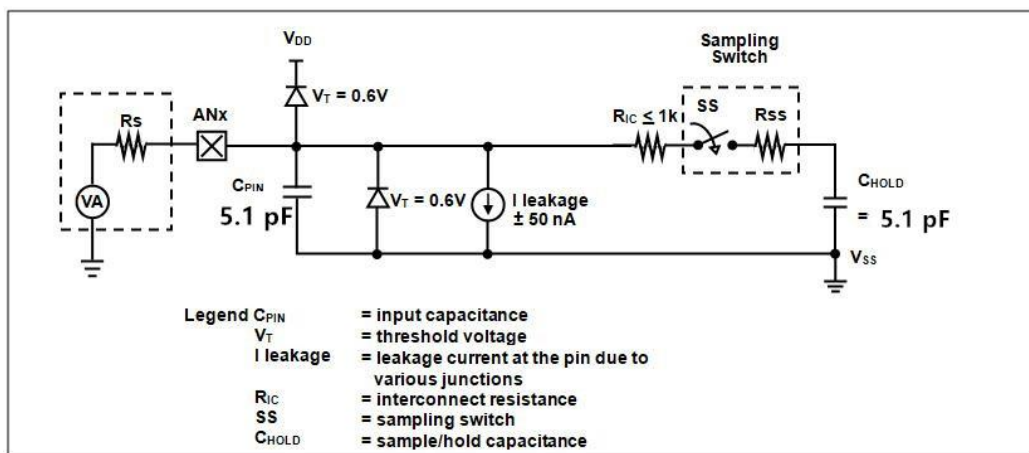

Fig.21: Analog Input Model

Before starting the AD conversion, the minimum signal acquisition time should be met for the selected analog input signal, the selection of ADCLK must be met the minimum signal acquisition time.

5.15.2 Select the reference high voltage

The ADC reference high voltage can be selected via bit[7:5] of register **adcrhc** and its option can be V_{DD} , 4V, 3V, 2V, 1.20V bandgap reference voltage or PB1 from external pin.

5.15.3 ADC clock selection

The clock of ADC module (ADCLK) can be selected by **adcm** register; there are 8 possible options for ADCLK from $CLK \div 1$ to $CLK \div 128$ (CLK is the system clock). Due to the signal acquisition time T_{ACQ} is one clock period of ADCLK, the ADCLK must meet that requirement. The recommended ADC clock is to operate at 2us.

5.15.4 Configure the analog pins

There are 14 analog signals can be selected for AD conversion, 13 analog input signals come from external pins and one is from internal bandgap reference voltage or $0.25 \cdot V_{DD}$. There are 4 voltage levels selectable for the internal bandgap reference, they are 1.2V, 2V, 3V and 4V. For external pins, the analog signals are shared with Port A[0], Port A[3], Port A[4], and Port B[7:0]. To avoid leakage current at the digital circuit, those pins defined for analog input should disable the digital input function (set the corresponding bit of **padier** / **pbdier** / **pcder** register to be 0).

The measurement signals of ADC belong to small signal; it should avoid the measured signal to be interfered during the measurement period, the selected pin should (1) be set to input mode (2) turn off weak pull-high resistor (3) set the corresponding pin to analog input by port A/B/C digital input disable register (**padier** / **pbdier** / **pcder**).

Note: when PC1 or PC2 is used as the AD input channel, the assignment command is different, and the emulation port will be different from the actual situation. Please refer to Table 8 for specific differences. The other channels are the same.

| AD channel during actual situation | instruction | AD channel during emulation |
|------------------------------------|----------------------|-----------------------------|
| PC1 | \$ ADCC enable, PC1; | PC1 |
| | ADCC=0bxx_1011_xx | PA1 |
| PC2 | \$ ADCC enable, PC2; | PA1 |
| | ADCC=0bxx_1100_xx | PC1 |

Table 8: the difference between PC1 and PC2 in emulation and the actual situation

5.15.5 Using the ADC

The following example shows how to use ADC with PB0~PB3.

First, defining the selected pins:

```

PBC      = 0B_XXXX_0000;    // PB0 ~ PB3 as Input
PBPH     = 0B_XXXX_0000;    // PB0 ~ PB3 without pull-high
PBDIER    = 0B_XXXX_0000;    // PB0 ~ PB3 digital input is disabled

```

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

Next, setting **ADCC** register, example as below:

```
$ ADCC Enable, PB3;           // set PB3 as ADC input
$ ADCC Enable, PB2;           // set PB2 as ADC input
$ ADCC Enable, PB0;           // set PB0 as ADC input
// Note: Only one input channel can be selected for each AD conversion
```

Next, setting **ADCM** and **ADCRGC** register, example as below:

```
$ ADCM 12BIT, /16;           // recommend /16 @System Clock=8MHz
$ ADCM 12BIT, /8;            // recommend /8 @System Clock=4MHz
$ ADCRGC VDD;
```

Next, delay 400us(ADCLK=500KHz, 200*ADCLK=400us), example as below:

```
.Delay 8*400;                // System Clock=8MHz
.Delay 4*400;                // System Clock=4MHz
```

Note: If using internal reference high voltage such as bandgap 1.2V or 2V/3V/4V, the delay time must be more than 1ms.

```
$ ASDCRGC 3V;                // AD reference voltage is 3V
.Delay 4*1010;               // if the system clock=4MHz
                             // the delay time must be more than 1ms
```

Please Note: If using bandgap 1.2V or 2V/3V/4V as ADC input channel, the delay time must be more than 1ms.

```
$ ADCC ADC
$ ADCRGC VDD ADC_BG BG_2V    // reference voltage is VDD
                             // input channel is BG_2V
.Delay 4*1010;               // if the system clock=4MHz
                             // the delay time must be more than 1ms
```

Then, start the ADC conversion:

```
AD_START = 1;                // start ADC conversion
while(!AD_DONE) NULL;        // wait ADC conversion result
```

Finally, it can read ADC result when AD_DONE is high:

```
WORD      = Data;             // two bytes result: ADCRH and ADCRL
Data$1    = ADCRH
Data$0    = ADCRL;
Data      = Data >> 4;
```

The ADC can be disabled by using the following method:

```
$ ADCC Disable;
```

or

```
ADCC      = 0;
```

5.15.6 ADC external RC recommendations

Switch switching will cause jitter on the path. It is recommended to keep 3 to 5 times of τ for the RC stabilization time.

Stabilization time after SW(CH) channel switching $3 \sim 5 * (Rin * Cin)$, assume **Vin is low frequency signals**.

SW(SH) sampling minimum time **8.4 * (Rsh * Csh) (this is not limiting factor)**

$Cin \geq (2^n - 1) * Csh$ (n : ADC resolution)

$Rsh \approx 1k\Omega$

5.16 Multiplier

There is an 8x8 multiplier on-chip to enhance hardware capability in arithmetic function, its multiplication is an 8x8 unsigned operation and can be finished in one clock cycle. Before issuing the **mul** command, both multiplicand and multiplier must be put on ACC and register **mulop** (0x08); After **mul** command, the high byte result will be put on register **mulrh** (0x09) and low byte result on ACC. The hardware diagram of this multiplier is shown as Fig.21.

Fig.22: Block diagram of hardware multiplier

6. IO Registers

6.1. ACC Status Flag Register (*flag*), IO address = 0x00

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 4 | - | - | Reserved. Please do not use. |
| 3 | 0 | R/W | OV (Overflow Flag). This bit is set to be 1 whenever the sign operation is overflow. |
| 2 | 0 | R/W | AC (Auxiliary Carry Flag). There are two conditions to set this bit, the first one is carry out of low nibble in addition operation and the other one is borrow from the high nibble into low nibble in subtraction operation. |
| 1 | 0 | R/W | C (Carry Flag). There are two conditions to set this bit, the first one is carry out in addition operation, and the other one is borrow in subtraction operation. Carry is also affected by shift with carry instruction. |
| 0 | 0 | R/W | Z (Zero Flag). This bit will be set when the result of arithmetic or logic operation is zero; Otherwise, it is cleared. |

6.2. Stack Pointer Register (*sp*), IO address = 0x02

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | - | R/W | Stack Pointer Register. Read out the current stack pointer, or write to change the stack pointer. Please notice that bit 0 should be kept 0 due to program counter is 16 bits. |

6.3. Clock Mode Register (*clkmd*), IO address = 0x03

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 5 | 111 | R/W | System clock (CLK) selection: |
| | | | Type 0, clkmd[3]=0 |
| | | | Type 1, clkmd[3]=1 |
| | | | <div> <div> 000: IHRC÷4 001: IHRC÷2 010: reserved 011: EOSC÷4 100: EOSC÷2 101: EOSC 110: ILRC÷4 111: ILRC (default) </div> <div> 000: IHRC÷16 001: IHRC÷8 010: ILRC÷16 (ICE does NOT Support.) 011: IHRC÷32 100: IHRC÷64 101: EOSC÷8 11x: reserved </div> </div> |
| 4 | 1 | R/W | Internal High RC Enable. 0 / 1: disable / enable |
| 3 | 0 | R/W | Clock Type Select. This bit is used to select the clock type in bit [7:5]. 0 / 1: Type 0 / Type 1. |
| 2 | 1 | R/W | Internal Low RC Enable. 0 / 1: disable / enable If ILRC is disabled, watchdog timer is also disabled. |
| 1 | 1 | R/W | Watch Dog Enable. 0 / 1: disable / enable |
| 0 | 0 | R/W | Pin PA5/PRSTB function. 0 / 1: PA5 / PRSTB. |

6.4. Interrupt Enable Register (*inten*), IO address = 0x04

| Bit | Reset | R/W | Description |
|-----|-------|-----|--|
| 7 | 0 | R/W | Enable interrupt from Timer3. 0 / 1: disable / enable. |
| 6 | 0 | R/W | Enable interrupt from Timer2. 0 / 1: disable / enable. |
| 5 | 0 | R/W | Enable interrupt from PWMG0. 0 / 1: disable / enable. |
| 4 | 0 | R/W | Enable interrupt from comparator. 0 / 1: disable / enable. |
| 3 | 0 | R/W | Enable interrupt from ADC. 0 / 1: disable / enable. |
| 2 | 0 | R/W | Enable interrupt from Timer16 overflow. 0 / 1: disable / enable. |
| 1 | 0 | R/W | Enable interrupt from PB0/PA4/PA3/PA6. 0 / 1: disable / enable. |
| 0 | 0 | R/W | Enable interrupt from PA0/PB5/PA2/PA7. 0 / 1: disable / enable. |

6.5. Interrupt Request Register (*intrq*), IO address = 0x05

| Bit | Reset | R/W | Description |
|-----|-------|-----|---|
| 7 | - | R/W | Interrupt Request from Timer3, this bit is set by hardware and cleared by software. 0 / 1: No request / Request |
| 6 | - | R/W | Interrupt Request from Timer2, this bit is set by hardware and cleared by software. 0 / 1: No request / Request |
| 5 | - | R/W | Interrupt Request from PWMG0, this bit is set by hardware and cleared by software. 0 / 1: No request / Request |
| 4 | - | R/W | Interrupt Request from comparator, this bit is set by hardware and cleared by software. 0 / 1: No request / Request |
| 3 | - | R/W | Interrupt Request from ADC, this bit is set by hardware and cleared by software. 0 / 1: No request / Request |
| 2 | - | R/W | Interrupt Request from Timer16, this bit is set by hardware and cleared by software. 0 / 1: No request / Request |
| 1 | - | R/W | Interrupt Request from pin PB0/PA4/PA3/PB6, this bit is set by hardware and cleared by software. 0 / 1: No request / Request |
| 0 | - | R/W | Interrupt Request from pin PA0/PB5/PA2/PA7, this bit is set by hardware and cleared by software. 0 / 1: No Request / request |

6.6. Timer16 mode Register (*t16m*), IO address = 0x06

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 5 | 000 | R/W | Timer16 Clock source selection. 000: disable 001: CLK (system clock) 010: reserved 011: PA4 falling edge (from external pin) 100: IHRC 101: EOSC 110: ILRC 111: PA0 falling edge (from external pin) |
| 4 - 3 | 00 | R/W | Timer16 clock pre-divider. 00: ÷1 01: ÷4 10: ÷16 11: ÷64 |
| 2 - 0 | 000 | R/W | Interrupt source selection. Interrupt event happens when the selected bit status is changed. 0 : bit 8 of Timer16 1 : bit 9 of Timer16 2 : bit 10 of Timer16 3 : bit 11 of Timer16 4 : bit 12 of Timer16 5 : bit 13 of Timer16 6 : bit 14 of Timer16 7 : bit 15 of Timer16 |

6.7. Multiplier Operand Register (*mulop*), IO address = 0x08

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | - | R/W | Operand for hardware multiplication operation. |

6.8. Multiplier Result High Byte Register (*mulrh*), IO address = 0x09

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 0 | - | RO | High byte result of multiplication operation (read only). |

6.9. External Oscillator setting Register (*eoscr*), IO address = 0x0a

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 | 0 | WO | Enable external crystal oscillator. 0 / 1 : Disable / Enable |
| 6 - 5 | 00 | WO | External crystal oscillator selection. 00 : reserved 01 : Low driving capability, for lower frequency, ex: 32KHz crystal oscillator 10 : Middle driving capability, for middle frequency, ex: 1MHz crystal oscillator 11 : High driving capability, for higher frequency, ex: 4MHz crystal oscillator |
| 4 - 1 | - | - | Reserved. Please keep 0 for future compatibility. |
| 0 | 0 | WO | Power-down the Bandgap and LVR hardware modules. 0 / 1: normal / power-down. Note: If bandgap be disabled, there will only ILRC/T16/TM2/TM3 and I/O function can be used. |

6.10. Interrupt Edge Select Register (*integs*), IO address = 0x0c

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 5 | - | - | Reserved. |
| 4 | 0 | WO | Timer16 edge selection. 0 : rising edge of the selected bit to trigger interrupt 1 : falling edge of the selected bit to trigger interrupt |
| 3 - 2 | 00 | WO | PB0/PA4/PA3/PB6 edge selection. 00: both rising edge and falling edge of the selected bit to trigger interrupt 01: rising edge of the selected bit to trigger interrupt 10: falling edge of the selected bit to trigger interrupt 11: reserved. |
| 1 - 0 | 00 | WO | PA0/PB5/PA2/PA7 edge selection. 00 : both rising edge and falling edge of the selected bit to trigger interrupt 01 : rising edge of the selected bit to trigger interrupt 10 : falling edge of the selected bit to trigger interrupt 11 : reserved. |

6.11. Port A Digital Input Enable Register (*padier*), IO address = 0x0d

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 0 | 0xFF | WO | Enable Port A digital input to prevent leakage when the pin is assigned for AD input. When disable is selected, the wakeup function from this pin is also disabled. 0 / 1 : disable / enable |

6.12. Port B Digital Input Enable Register (*pbdier*), IO address = 0x0e

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 0 | 0xFF | WO | Enable Port B digital input to prevent leakage when the pin is assigned for AD input. When disable is selected, the wakeup function from this pin is also disabled. 0 / 1 : disable / enable |

6.13. Port C Digital Input Enable Register (*pcdier*), IO address = 0x0f

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 0 | 0xFF | WO | Enable Port C digital input to prevent leakage when the pin is assigned for AD input. When disable is selected, the wakeup function from this pin is also disabled. 0 / 1 : disable / enable |

Note: Detail settings please refer to Section 9.2.

6.14. Port A Data Register (*pa*), IO address = 0x10

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------|
| 7 - 0 | 0x00 | R/W | Data register for Port A. |

6.15. Port A Control Register (*pac*), IO address = 0x11

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 0 | 0x00 | R/W | Port A control registers. This register is used to define input mode or output mode for each corresponding pin of port A. 0 / 1: input / output <u>Please note that PA5 can be INPUT or OUTPUT LOW ONLY, the output state will be tri-state when PA5 is programmed into output mode with data 1.</u> |

6.16. Port A Pull-High Register (*paph*), IO address = 0x12

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 0 | 0x00 | R/W | Port A pull-high register. This register is used to enable the internal pull-high device on each corresponding pin of port A and this pull high function is active only for input mode. 0 / 1 : disable / enable |

6.17. Port B Data Register (*pb*), IO address = 0x13

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------|
| 7 - 0 | 0x00 | R/W | Data register for Port B. |

6.18. Port B Control Register (*pbc*), IO address = 0x14

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | 0x00 | R/W | Port B control register. This register is used to define input mode or output mode for each corresponding pin of port B. 0 / 1: input / output |

6.19. Port B Pull-High Register (*pbph*), IO address = 0x15

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | 0x00 | R/W | Port B pull-high register. This register is used to enable the internal pull-high device on each corresponding pin of port B and this pull high function is active only for input mode. 0 / 1 : disable / enable |

6.20. Port C Data Register (*pc*), IO address = 0x16

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------|
| 7 - 0 | 0x00 | R/W | Data register for Port C. |

6.21. Port C Control Register (*pcc*), IO address = 0x17

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | 0x00 | R/W | Port C control register. This register is used to define input mode or output mode for each corresponding pin of port B. 0 / 1: input / output |

6.22. Port C Pull-High Register (*pcph*), IO address = 0x18

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | 0x00 | R/W | Port C pull-high register. This register is used to enable the internal pull-high device on each corresponding pin of port C and this pull high function is active only for input mode. 0 / 1 : disable / enable |

6.23. ADC Control Register (*adcc*), IO address = 0x20

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 | 0 | R/W | Enable ADC function. 0/1: Disable/Enable. |
| 6 | 0 | R/W | ADC process control bit. Write "1" to start conversion Read "1" to indicate the ADC is ready or end of conversion. |
| 5 - 2 | 0000 | R/W | Channel selector. These four bits are used to select input signal for AD conversion. 0000: PB0/AD0, 0001: PB1/AD1, 0010: PB2/AD2, 0011: PB3/AD3, 0100: PB4/AD4, 0101: PB5/AD5, 0110: PB6/AD6, 0111: PB7/AD7, 1000: PA3/AD8, 1001: PA4/AD9, 1010: PA0/AD10, 1011: PC1/AD11, (PC1 or PA1 for ICE at this address, please refer to section 5.15.4) 1100: PC2/AD12, (PC1 or PA1 for ICE at this address, please refer to section 5.15.4) 1111: (Channel F) Bandgap reference voltage or 0.25*V _{DD} Others: reserved |
| 0 - 1 | - | - | Reserved. (keep 0 for future compatibility) |

6.24. ADC Mode Register (*adcm*), IO address = 0x21

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 5 | 000 | WO | Bit Resolution. |
| 4 | - | - | Reserved (keep 0 for future compatibility) |
| 3 - 1 | 000 | R/W | ADC clock source selection. 000: CLK (system clock) ÷ 1, 001: CLK (system clock) ÷ 2, 010: CLK (system clock) ÷ 4, 011: CLK (system clock) ÷ 8, 100: CLK (system clock) ÷ 16, 101: CLK (system clock) ÷ 32, 110: CLK (system clock) ÷ 64, 111: CLK (system clock) ÷ 128, |
| 0 | - | - | Reserved. |

6.25. ADC Regulator Control Register (*adcr gc*), IO address = 0x24

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 5 | 000 | WO | These three bits are used to select input signal for ADC reference high voltage. 000: V_{DD} , 001: 2V, 010: 3V, 011: 4V, 100: PB1, 101: Bandgap 1.20 volt reference voltage Others: reserved |
| 4 | 0 | WO | ADC channel F selector: 0: Bandgap reference voltage 1: $0.25 \cdot V_{DD}$. The deviation is within $\pm 0.01 \cdot V_{DD}$ mostly. |
| 3 - 2 | 00 | WO | Bandgap reference voltage selector for ADC channel F: (ICE is fixed to 1.2V) 00: 1.2V 01: 2V 10: 3V 11: 4V |
| 1 - 0 | - | - | Reserved. Please keep 0. |

6.26. ADC Result High Register (*adcrh*), IO address = 0x22

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | - | RO | These eight read-only bits will be the bit [11:4] of AD conversion result. The bit 7 of this register is the MSB of ADC result for any resolution. |

6.27. ADC Result Low Register (*adcr l*), IO address = 0x23

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 4 | - | RO | These four bits will be the bit [3:0] of AD conversion result. |
| 3 - 0 | - | - | Reserved. |

6.28. MISC Register (misc), IO address = 0x26

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 6 | - | - | Reserved. (keep 0 for future compatibility) |
| 5 | 0 | WO | Enable fast Wake up. Fast wake-up is NOT supported when EOSC is enabled. 0: Normal wake up. The wake-up time is 3000 ILRC clocks (Not for fast boot-up) 1: Fast wake up. The wake-up time is 45 ILRC clocks. |
| 4 | 0 | WO | Enable VDD/2 LCD bias voltage generator. 0 / 1 : Disable / Enable (ICE cannot be dynamically switched) If Code Option selects LCD output, but MISC.4 does not set to 1, then the VDD/2 bias cannot be output on the IC. However, the emulator is always OK. Two above phenomena are different. |
| 3 | - | - | Reserved. |
| 2 | 0 | WO | Disable LVR function. 0 / 1 : Enable / Disable |
| 1 - 0 | 00 | WO | Watch dog time out period 00: 8k ILRC clock period 01: 16k ILRC clock period 10: 64k ILRC clock period 11: 256k ILRC clock period |

6.29. Comparator Control Register (gpcc), IO address = 0x2b

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 | 0 | R/W | Enable comparator. 0 / 1 : disable / enable When this bit is set to enable, please also set the corresponding analog input pins to be digital disable to prevent IO leakage. |
| 6 | - | RO | Comparator result of comparator. 0: plus input < minus input 1: plus input > minus input |
| 5 | 0 | R/W | Select whether the comparator result output will be sampled by TM2_CLK? 0: result output NOT sampled by TM2_CLK 1: result output sampled by TM2_CLK |
| 4 | 0 | R/W | Inverse the polarity of result output of comparator. 0: polarity is NOT inversed. 1: polarity is inversed. |
| 3 - 1 | 000 | R/W | Selection the minus input (-) of comparator. 000 : PA3 001 : PA4 010 : Internal 1.20 volt bandgap reference voltage (not suitable for the comparator wake-up function) 011 : V _{internal R} |

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

| Bit | Reset | R/W | Description |
|-----|-------|-----|---|
| | | | 100 : PB6 101 : PB7 11X: reserved |
| 0 | 0 | R/W | Selection the plus input (+) of comparator. 0 : V _{internal R} 1 : PA4 |

6.30. Comparator Selection Register (*gpcs*), IO address = 0x2c

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 | 0 | WO | Comparator output enable (to PA0). 0 / 1 : disable / enable |
| 6 | - | WO | Wakeup by comparator enable. (The comparator wakeup effectively when gpcc.6 electrical level changed) 0 / 1 : disable / enable |
| 5 | 0 | WO | Selection of high range of comparator. |
| 4 | 0 | WO | Selection of low range of comparator. |
| 3 - 0 | 0000 | WO | Selection the voltage level of comparator. 0000(lowest) ~ 1111 (highest) |

6.31. Timer2 Control Register (*tm2c*), IO address = 0x30

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 4 | 0000 | R/W | Timer2 clock selection. 0000 : disable 0001 : CLK 0010 : IHRC or IHRC *2 (by code option TMx_source) 0011 : EOSC 0100 : ILRC 0101 : comparator output (ICE does NOT Support.) 1000 : PA0 (rising edge) 1001 : ~PA0 (falling edge) 1010 : PB0 (rising edge) 1011 : ~PB0 (falling edge) 1100 : PA4 (rising edge) 1101 : ~PA4 (falling edge) Others: reserved Notice: In ICE mode and IHRC is selected for Timer2 clock, the clock sent to Timer2 does NOT be stopped, Timer2 will keep counting when ICE is in halt state. |
| 3 - 2 | 00 | R/W | Timer2 output selection. 00 : disable 01 : PB2 10 : PA3 11 : PB4 |

| Bit | Reset | R/W | Description |
|-----|-------|-----|---|
| 1 | 0 | R/W | Timer2 mode selection. 0 / 1 : period mode / PWM mode |
| 0 | 0 | R/W | Enable to inverse the polarity of Timer2 output. 0 / 1: disable / enable |

6.32. Timer2 Counter Register (*tm2ct*), IO address = 0x31

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------------------|
| 7 - 0 | 0x00 | R/W | Bit [7:0] of Timer2 counter register. |

6.33. Timer2 Scalar Register (*tm2s*), IO address = 0x32

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 | 0 | WO | PWM resolution selection. 0 : 8-bit 1 : 6-bit or 7-bit (by code option TMx_bit) |
| 6 - 5 | 00 | WO | Timer2 clock pre-scalar. 00 : ÷ 1 01 : ÷ 4 10 : ÷ 16 11 : ÷ 64 |
| 4 - 0 | 00000 | W | Timer2 clock scalar. |

6.34. Timer2 Bound Register (*tm2b*), IO address = 0x33

| Bit | Reset | R/W | Description |
|-------|-------|-----|------------------------|
| 7 - 0 | 0x00 | WO | Timer2 bound register. |

6.35. Timer3 Control Register (*tm3c*), IO address = 0x34

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 4 | 0000 | R/W | Timer3 clock selection. 0000 : disable 0001 : CLK 0010 : IHRC or IHRC *2 (by code option TMx_source) 0011 : EOSC 0100 : ILRC 0101 : comparator output 1000 : PA0 (rising edge) 1001 : ~PA0 (falling edge) 1010 : PB0 (rising edge) 1011 : ~PB0 (falling edge) 1100 : PA4 (rising edge) 1101 : ~PA4 (falling edge) Others: reserved Notice: In ICE mode and IHRC is selected for Timer3 clock, the clock sent to Timer3 does NOT be stopped, Timer3 will keep counting when ICE is in halt state. |
| 3 - 2 | 00 | R/W | Timer3 output selection. |

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

| Bit | Reset | R/W | Description |
|-----|-------|-----|---|
| | | | 00 : disable 01 : PB5 10 : PB6 11 : PB7 |
| 1 | 0 | R/W | Timer3 mode selection. 0 / 1 : period mode / PWM mode |
| 0 | 0 | R/W | Enable to inverse the polarity of Timer3 output. 0 / 1: disable / enable |

6.36. Timer3 Counter Register (*tm3ct*), IO address = 0x35

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------------------|
| 7 - 0 | 0x00 | R/W | Bit [7:0] of Timer2 counter register. |

6.37. Timer3 Scalar Register (*tm3s*), IO address = 0x36

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 | 0 | WO | PWM resolution selection. 0 : 8-bit 1 : 6-bit or 7-bit (by code option TMx_bit) |
| 6 - 5 | 00 | WO | Timer3 clock pre-scalar. 00 : ÷ 1 01 : ÷ 4 10 : ÷ 16 11 : ÷ 64 |
| 4 - 0 | 00000 | WO | Timer3 clock scalar. |

6.38. Timer3 Bound Register (*tm3b*), IO address = 0x37

| Bit | Reset | R/W | Description |
|-------|-------|-----|------------------------|
| 7 - 0 | 0x00 | WO | Timer3 bound register. |

6.39. PWMG0 control Register (*pwmg0c*), IO address = 0x40

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 | 0 | R/W | Enable PWMG0 generator. 0 / 1 : disable / enable. |
| 6 | - | RO | Output status of PWMG0 generator. |
| 5 | 0 | R/W | Enable to inverse the polarity of PWMG0 generator output. 0 / 1 : disable / enable. |
| 4 | 0 | R/W | PWMG0 counter reset. Writing “1” to clear PWMG0 counter and this bit will be self-clear to 0 after counter reset |
| 3 - 1 | 000 | R/W | Select PWM output pin for PWMG0. 000: none 001: PB5 010: PC2 011: PA0 100: PB4 Others: reserved |

| Bit | Reset | R/W | Description |
|-----|-------|-----|---|
| 0 | 0 | R/W | Clock source of PWMG0 generator. 0: CLK, 1: IHRC or IHRC*2 (by code option PWM_source) |

6.40. PWMG0 Scalar Register (*pwmg0s*), IO address = 0x41

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 | 0 | WO | PWMG0 interrupt mode. 0: Generate interrupt when counter matches the duty value 1: Generate interrupt when counter is 0. |
| 6 - 5 | 00 | WO | PWMG0 clock pre-scalar. 00 : ÷1 01 : ÷4 10 : ÷16 11 : ÷64 |
| 4 - 0 | 00000 | WO | PWMG0 clock divider. |

6.41. PWMG0 Duty Value High Register (*pwmg0dth*), IO address = 0x42

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------------|
| 7 - 0 | - | WO | Duty values bit[10:3] of PWMG0. |

6.42. PWMG0 Duty Value Low Register (*pwmg0dtl*), IO address = 0x43

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------------|
| 7 - 5 | - | WO | Duty values bit [2:0] of PWMG0. |
| 4 - 0 | - | - | Reserved. |

Note: It's necessary to write PWMG0 Duty_Value Low Register before writing PWMG0 Duty_Value High Register.

6.43. PWMG0 Counter Upper Bound High Register (*pwmg0cubh*), IO address = 0x44

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | - | WO | Bit [10:3] of PWMG0 counter upper bound. |

6.44. PWMG0 Counter Upper Bound Low Register (*pwmg0cubl*), IO address = 0x45

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 6 | - | WO | Bit [2:1] of PWMG0 counter upper bound. |
| 5 - 0 | - | - | Reserved. |

6.45. PWMG1 control Register (*pwmg1c*), IO address = 0x46

| Bit | Reset | R/W | Description |
|-----|-------|-----|---|
| 7 | 0 | R/W | Enable PWMG1. 0 / 1: disable / enable. |
| 6 | - | RO | Output of PWMG1. |
| 5 | 0 | R/W | Enable to inverse the polarity of PWMG1 output. 0 / 1 : disable / enable. |
| 4 | 0 | R/W | PWMG1 counter reset. Writing "1" to clear PWMG1 counter. |

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 3 - 1 | 000 | R/W | Select PWMG1 output pin. 000: none 001: PB6 010: PC3 011: PA4 100: PB7 Others: reserved |
| 0 | 0 | R/W | Clock source of PWMG1 generator. 0: CLK, 1: IHRC or IHRC*2 (by code option PWM_source) |

6.46. PWMG1 Scalar Register (pwmg1s), IO address = 0x47

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 | 0 | WO | PWMG1 interrupt mode. 0: Generate interrupt when counter matches the duty value. 1: Generate interrupt when counter is 0. |
| 6 - 5 | 00 | WO | PWMG1 clock pre-scalar. 00 : ÷1 01 : ÷4 10 : ÷16 11 : ÷64 |
| 4 - 0 | 00000 | WO | PWMG1 clock divider. |

6.47. PWMG1 Duty Value High Register (pwmg1dth), IO address = 0x48

| Bit | Reset | R/W | Description |
|-------|-------|-----|----------------------------------|
| 7 - 0 | 0x00 | WO | Duty values bit [10:3] of PWMG1. |

6.48. PWMG1 Duty Value Low Register (pwmg1dtl), IO address = 0x49

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------------|
| 7 - 5 | 000 | W | Duty values bit [2:0] of PWMG1. |
| 4 - 0 | - | - | Reserved. |

Note: It's necessary to write PWMG1 Duty_Value Low Register before writing PWMG1 Duty_Value High Register.

6.49. PWMG1 Counter Upper Bound High Register (pwmg1cubh), IO address = 0x4a

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 0 | 0x00 | WO | Bit[10:3] of PWMG1 counter upper bound. |

6.50. PWMG1 Counter Upper Bound Low Register (pwmg1cubl), IO address = 0x04b

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 6 | 000 | WO | Bit[2:1] of PWMG1 counter upper bound. |
| 5 - 0 | - | - | Reserved |

6.51. PWMG2 control Register (pwmg2c), IO address = 0x4C

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 | 0 | R/W | Enable PWMG2. 0 / 1 : disable / enable. |
| 6 | - | RO | Output of PWMG2. |
| 5 | 0 | R/W | Enable to inverse the polarity of PWMG2 output. 0 / 1 : disable / enable. |
| 4 | 0 | R/W | PWMG2 counter reset. Writing “1” to clear PWMG2 counter. |
| 3 - 1 | 000 | R/W | Select PWMG2 output pin. 000: disable 001: PB3 010: PC0 011: PA3 100: PB2 Others: reserved |
| 0 | 0 | R/W | Clock source of PWMG2 generator. 0: CLK, 1: IHRC or IHRC*2 (by code option PWM_source) |

6.52. PWMG2 Scalar Register (pwmg2s), IO address = 0x4D

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 | 0 | WO | PWMG2 interrupt mode. 0: Generate interrupt when counter matches the duty value. 1: Generate interrupt when counter is 0. |
| 6 - 5 | 00 | WO | PWMG2 clock pre-scalar. 00 : ÷1 01 : ÷4 10 : ÷16 11 : ÷64 |
| 4 - 0 | 00000 | WO | PWMG2 clock divider. |

6.53. PWMG2 Duty Value High Register (pwmg2dth), IO address = 0x4E

| Bit | Reset | R/W | Description |
|-------|-------|-----|----------------------------------|
| 7 - 0 | 0x00 | WO | Duty values bit [10:3] of PWMG2. |

6.54. PWMG2 Duty Value Low Register (pwmg2dtl), IO address = 0x4F

| Bit | Reset | R/W | Description |
|-------|-------|-----|---------------------------------|
| 7 - 5 | 000 | WO | Duty values bit [2:0] of PWMG2. |
| 4 - 0 | - | - | Reserved. |

Note: It's necessary to write PWMG2 Duty_Value Low Register before writing PWMG2 Duty_Value High Register.

6.55. PWMG2 Counter Upper Bound High Register (pwmg2cubh), IO address = 0x50

| Bit | Reset | R/W | Description |
|-------|-------|-----|--|
| 7 - 0 | 0x00 | WO | Bit [10:3] of PWMG2 counter upper bound. |

6.56. PWMG2 Counter Upper Bound Low Register (pwmg2cubl), IO address = 0x51

| Bit | Reset | R/W | Description |
|-------|-------|-----|---|
| 7 - 6 | 000 | WO | Bit [2:1] of PWMG2 counter upper bound. |
| 5 - 0 | - | - | Reserved. |

7. Instructions

| Symbol | Description |
|--------------|---|
| ACC | Accumulator (Abbreviation of accumulator) |
| a | Accumulator (symbol of accumulator in program) |
| sp | Stack pointer |
| flag | ACC status flag register |
| I | Immediate data |
| & | Logical AND |
| | Logical OR |
| ← | Movement |
| ^ | Exclusive logic OR |
| + | Add |
| — | Subtraction |
| ~ | NOT (logical complement, 1' s complement) |
| ⌅ | NEG (2' s complement) |
| OV | Overflow (The operational result is out of range in signed 2' s complement number system) |
| Z | Zero (If the result of ALU operation is zero, this bit is set to 1) |
| C | Carry (The operational result is to have carry out for addition or to borrow carry for subtraction in unsigned number system) |
| AC | Auxiliary Carry (If there is a carry out from low nibble after the result of ALU operation, this bit is set to 1) |
| M.n | Only addressed in 0x00~0x7F (0~127) is allowed |

7.1. Data Transfer Instructions

| | |
|---------------------|---|
| <i>mov</i> a, I | <p>Move immediate data into ACC.</p> <p>Example: <i>mov</i> a, 0x0f;</p> <p>Result: $a \leftarrow 0fh$;</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>mov</i> M, a | <p>Move data from ACC into memory</p> <p>Example: <i>mov</i> MEM, a;</p> <p>Result: $MEM \leftarrow a$</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>mov</i> a, M | <p>Move data from memory into ACC</p> <p>Example: <i>mov</i> a, MEM ;</p> <p>Result: $a \leftarrow MEM$; Flag Z is set when MEM is zero.</p> <p>Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>mov</i> a, IO | <p>Move data from IO into ACC</p> <p>Example: <i>mov</i> a, pa ;</p> <p>Result: $a \leftarrow pa$; Flag Z is set when pa is zero.</p> <p>Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>mov</i> IO, a | <p>Move data from ACC into IO</p> <p>Example: <i>mov</i> pb, a;</p> <p>Result: $pb \leftarrow a$</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>nmov</i> M, a | <p>Take the negative logic (2' s complement) of ACC to put on memory</p> <p>Example: <i>mov</i> MEM, a;</p> <p>Result: $MEM \leftarrow \overline{a}$</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> <hr/> <pre> mov a, 0xf5 ; // ACC is 0xf5 nmov ram9, a; // ram9 is 0x0b, ACC is 0xf5 </pre> <hr/> |
| <i>nmov</i> a, M | <p>Take the negative logic (2' s complement) of memory to put on ACC</p> <p>Example: <i>mov</i> a, MEM ;</p> <p>Result: $a \leftarrow \overline{MEM}$; Flag Z is set when \overline{MEM} is zero.</p> <p>Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> <hr/> <pre> mov a, 0xf5 ; mov ram9, a ; // ram9 is 0xf5 nmov a, ram9 ; // ram9 is 0xf5, ACC is 0x0b </pre> <hr/> |
| <i>ldtabh</i> index | <p>Load high byte data in OTP program memory to ACC by using index as OTP address. It needs 2T to execute this instruction.</p> <p>Example: <i>ldtabh</i> index;</p> <p>Result: $a \leftarrow \{bit\ 15 \sim 8\ of\ OTP\ [index]\}$;</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> <hr/> <pre> word ROMptr ; // declare a pointer of ROM in RAM </pre> <hr/> |

| | |
|---------------------|---|
| | <pre> ... mov a, la@TableA ; // assign pointer to ROM TableA (LSB) mov lb@ROMptr, a ; // save pointer to RAM (LSB) mov a, ha@TableA ; // assign pointer to ROM TableA (MSB) mov hb@ROMptr, a ; // save pointer to RAM (MSB) ... ldtabh ROMptr ; // load TableA MSB to ACC (ACC=0x02) ... TableA : dc 0x0234, 0x0042, 0x0024, 0x0018 ; </pre> |
| <i>ldtabl</i> index | <p>Load low byte data in OTP to ACC by using index as OTP address. It needs 2T to execute this instruction.</p> <p>Example: <i>ldtabl</i> index;</p> <p>Result: $a \leftarrow \{\text{bit7} \sim 0 \text{ of OTP [index]}\}$;</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> <pre> word ROMptr ; // declare a pointer of ROM in RAM ... mov a, la@TableA ; // assign pointer to ROM TableA (LSB) mov lb@ROMptr, a ; // save pointer to RAM (LSB) mov a, ha@TableA ; // assign pointer to ROM TableA (MSB) mov hb@ROMptr, a ; // save pointer to RAM (MSB) ... ldtabl ROMptr ; // load TableA LSB to ACC (ACC=0x34) ... TableA : dc 0x0234, 0x0042, 0x0024, 0x0018 ; </pre> |
| <i>ldt16</i> word | <p>Move 16-bit counting values in Timer16 to memory in word.</p> <p>Example: <i>ldt16</i> word;</p> <p>Result: $\text{word} \leftarrow \text{16-bit timer}$</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> <pre> word T16val ; // declare a RAM word ... clear lb@ T16val ; // clear T16val (LSB) clear hb@ T16val ; // clear T16val (MSB) stt16 T16val ; // initial T16 with 0 ... set1 t16m.5 ; // enable Timer16 ... set0 t16m.5 ; // disable Timer 16 ldt16 T16val ; // save the T16 counting value to T16val ... </pre> |

| | |
|----------------------|---|
| <i>stt16</i> word | <p>Store 16-bit data from memory in word to Timer16.</p> <p>Example: <i>stt16</i> word;</p> <p>Result: 16-bit timer \leftarrow word</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre> word T16val ; // declare a RAM word ... mov a, 0x34 ; mov lb@ T16val , a ; // move 0x34 to T16val (LSB) mov a, 0x12 ; mov hb@ T16val , a ; // move 0x12 to T16val (MSB) stt16 T16val ; // initial T16 with 0x1234 </pre> <hr style="border-top: 1px dashed black;"/> |
| <i>xch</i> M | <p>Exchange data between ACC and memory</p> <p>Example: <i>xch</i> MEM ;</p> <p>Result: MEM \leftarrow a , a \leftarrow MEM</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>popaf</i> | <p>Restore ACC and flag from the memory which address is specified in the stack pointer.</p> <p>Example: <i>popaf</i>;</p> <p>Result: sp \leftarrow sp - 2 ;</p> <p>{Flag, ACC} \leftarrow [sp] ;</p> <p>Affected flags: 『Y』 Z 『Y』 C 『Y』 AC 『Y』 OV</p> |
| <i>idxm</i> index, a | <p>Move data from ACC to specified memory by indirect method. It needs 2T to execute this instruction.</p> <p>Example: <i>idxm</i> index, a;</p> <p>Result: [index] \leftarrow a; where index is declared by word.</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre> word RAMIndex ; // declare a RAM pointer ... mov a, 0x5B ; // assign pointer to an address (LSB) mov lb@RAMIndex, a ; // save pointer to RAM (LSB) mov a, 0x00 ; // assign 0x00 to an address (MSB), should be 0 mov hb@RAMIndex, a ; // save pointer to RAM (MSB) ... mov a, 0xA5 ; idxm RAMIndex, a ; // mov 0xA5 to memory in address 0x5B </pre> <hr style="border-top: 1px dashed black;"/> |
| <i>idxm</i> a, index | <p>Move data from specified memory to ACC by indirect method. It needs 2T to execute this instruction.</p> <p>Example: <i>idxm</i> a, index;</p> <p>Result: a \leftarrow [index], where index is declared by word.</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> |

| | |
|---------------|--|
| | <pre> word RAMIndex ; // declare a RAM pointer ... mov a, 0x5B ; // assign pointer to an address (LSB) mov lb@RAMIndex, a ; // save pointer to RAM (LSB) mov a, 0x00 ; // assign 0x00 to an address (MSB), should be 0 mov hb@RAMIndex, a ; // save pointer to RAM (MSB) ... idxm a, RAMIndex ; // move memory data in address 0x5B to ACC </pre> |
| <i>pushaf</i> | <p>Move the ACC and flag register to memory that address specified in the stack pointer. Example: <code>pushaf</code>; Result: $[sp] \leftarrow \{\text{flag}, \text{ACC}\};$ $sp \leftarrow sp + 2;$ Affected flags: $\text{『N』 Z } \text{『N』 C } \text{『N』 AC } \text{『N』 OV}$ Application Example:</p> <pre> .romadr 0x10 ; // ISR entry address pushaf ; // put ACC and flag into stack memory ... // ISR program ... // ISR program popaf ; // restore ACC and flag from stack memory reti ; </pre> |

7.2. Arithmetic Operation Instructions

| | |
|------------------|---|
| <i>add</i> a, I | <p>Add immediate data with ACC, then put result into ACC Example: <code>add a, 0x0f</code>; Result: $a \leftarrow a + 0fh$ Affected flags: $\text{『Y』 Z } \text{『Y』 C } \text{『Y』 AC } \text{『Y』 OV}$</p> |
| <i>add</i> a, M | <p>Add data in memory with ACC, then put result into ACC Example: <code>add a, MEM</code>; Result: $a \leftarrow a + \text{MEM}$ Affected flags: $\text{『Y』 Z } \text{『Y』 C } \text{『Y』 AC } \text{『Y』 OV}$</p> |
| <i>add</i> M, a | <p>Add data in memory with ACC, then put result into memory Example: <code>add MEM, a</code>; Result: $\text{MEM} \leftarrow a + \text{MEM}$ Affected flags: $\text{『Y』 Z } \text{『Y』 C } \text{『Y』 AC } \text{『Y』 OV}$</p> |
| <i>addc</i> a, M | <p>Add data in memory with ACC and carry bit, then put result into ACC Example: <code>addc a, MEM</code>; Result: $a \leftarrow a + \text{MEM} + C$ Affected flags: $\text{『Y』 Z } \text{『Y』 C } \text{『Y』 AC } \text{『Y』 OV}$</p> |
| <i>addc</i> M, a | <p>Add data in memory with ACC and carry bit, then put result into memory Example: <code>addc MEM, a</code>; Result: $\text{MEM} \leftarrow a + \text{MEM} + C$ Affected flags: $\text{『Y』 Z } \text{『Y』 C } \text{『Y』 AC } \text{『Y』 OV}$</p> |
| <i>addc</i> a | <p>Add carry with ACC, then put result into ACC</p> |

| | |
|------------------------|---|
| | <p>Example: <code>addc a ;</code> Result: $a \leftarrow a + C$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>addc M</code> | <p>Add carry with memory, then put result into memory Example: <code>addc MEM ;</code> Result: $\text{MEM} \leftarrow \text{MEM} + C$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>nadd a, M</code> | <p>Add negative logic (2' s complement) of ACC with memory Example: <code>nadd a, MEM ;</code> Result: $a \leftarrow \overline{a} + \text{MEM}$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>nadd M, a</code> | <p>Add negative logic (2' s complement) of memory with ACC Example: <code>nadd MEM, a ;</code> Result: $\text{MEM} \leftarrow \overline{\text{MEM}} + a$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>sub a, l</code> | <p>Subtraction immediate data from ACC, then put result into ACC. Example: <code>sub a, 0x0f;</code> Result: $a \leftarrow a - 0fh \text{ (} a + [2' \text{ s complement of } 0fh] \text{)}$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>sub a, M</code> | <p>Subtraction data in memory from ACC, then put result into ACC Example: <code>sub a, MEM ;</code> Result: $a \leftarrow a - \text{MEM} \text{ (} a + [2' \text{ s complement of } M] \text{)}$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>sub M, a</code> | <p>Subtraction data in ACC from memory, then put result into memory Example: <code>sub MEM, a;</code> Result: $\text{MEM} \leftarrow \text{MEM} - a \text{ (} \text{MEM} + [2' \text{ s complement of } a] \text{)}$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>subc a, M</code> | <p>Subtraction data in memory and carry from ACC, then put result into ACC Example: <code>subc a, MEM;</code> Result: $a \leftarrow a - \text{MEM} - C$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>subc M, a</code> | <p>Subtraction ACC and carry bit from memory, then put result into memory Example: <code>subc MEM, a ;</code> Result: $\text{MEM} \leftarrow \text{MEM} - a - C$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>subc a</code> | <p>Subtraction carry from ACC, then put result into ACC Example: <code>subc a;</code> Result: $a \leftarrow a - C$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>subc M</code> | <p>Subtraction carry from the content of memory, then put result into memory Example: <code>subc MEM;</code> Result: $\text{MEM} \leftarrow \text{MEM} - C$ Affected flags: $\text{『Y』Z} \quad \text{『Y』C} \quad \text{『Y』AC} \quad \text{『Y』OV}$</p> |
| <code>inc M</code> | <p>Increment the content of memory Example: <code>inc MEM ;</code></p> |

| | |
|----------------|---|
| | Result: $MEM \leftarrow MEM + 1$ Affected flags: 『Y』 Z 『Y』 C 『Y』 AC 『Y』 OV |
| <i>dec</i> M | Decrement the content of memory Example: <i>dec</i> MEM; Result: $MEM \leftarrow MEM - 1$ Affected flags: 『Y』 Z 『Y』 C 『Y』 AC 『Y』 OV |
| <i>clear</i> M | Clear the content of memory Example: <i>clear</i> MEM ; Result: $MEM \leftarrow 0$ Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>mul</i> | Multiplication operation, 8x8 unsigned multiplications will be executed. Example: <i>mul</i> ; Result: {MulRH,ACC} \leftarrow ACC * MulOp Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV Application Example : <hr/> <pre> ... mov a, 0x5a ; mov mulop, a ; mov a, 0xa5 ; mul // 0x5A * 0xA5 = 3A02 (mulrh + ACC) mov ram0, a ; // LSB, ram0=0x02 mov a, mulrh ; // MSB, ACC=0X3A ... </pre> <hr/> |

7.3. Shift Operation Instructions

| | |
|--------------|--|
| <i>sr</i> a | Shift right of ACC, shift 0 to bit 7 Example: <i>sr</i> a ; Result: $a(0,b7,b6,b5,b4,b3,b2,b1) \leftarrow a(b7,b6,b5,b4,b3,b2,b1,b0)$, $C \leftarrow a(b0)$ Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV |
| <i>src</i> a | Shift right of ACC with carry bit 7 to flag Example: <i>src</i> a ; Result: $a(c,b7,b6,b5,b4,b3,b2,b1) \leftarrow a(b7,b6,b5,b4,b3,b2,b1,b0)$, $C \leftarrow a(b0)$ Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV |
| <i>sr</i> M | Shift right the content of memory, shift 0 to bit 7 Example: <i>sr</i> MEM ; Result: $MEM(0,b7,b6,b5,b4,b3,b2,b1) \leftarrow MEM(b7,b6,b5,b4,b3,b2,b1,b0)$, $C \leftarrow MEM(b0)$ Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV |
| <i>src</i> M | Shift right of memory with carry bit 7 to flag Example: <i>src</i> MEM ; Result: $MEM(c,b7,b6,b5,b4,b3,b2,b1) \leftarrow MEM(b7,b6,b5,b4,b3,b2,b1,b0)$, $C \leftarrow MEM(b0)$ Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV |
| <i>sl</i> a | Shift left of ACC shift 0 to bit 0 Example: <i>sl</i> a ; Result: $a(b6,b5,b4,b3,b2,b1,b0,0) \leftarrow a(b7,b6,b5,b4,b3,b2,b1,b0)$, $C \leftarrow a(b7)$ |

| | |
|---------------|--|
| | Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV |
| <i>s/c a</i> | Shift left of ACC with carry bit 0 to flag Example: <i>s/c a</i> ; Result: $a(b6, b5, b4, b3, b2, b1, b0, c) \leftarrow a(b7, b6, b5, b4, b3, b2, b1, b0), C \leftarrow a(b7)$ Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV |
| <i>s/ M</i> | Shift left of memory, shift 0 to bit 0 Example: <i>s/ MEM</i> ; Result: $MEM(b6, b5, b4, b3, b2, b1, b0, 0) \leftarrow MEM(b7, b6, b5, b4, b3, b2, b1, b0), C \leftarrow MEM(b7)$ Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV |
| <i>s/c M</i> | Shift left of memory with carry bit 0 to flag Example: <i>s/c MEM</i> ; Result: $MEM(b6, b5, b4, b3, b2, b1, b0, C) \leftarrow MEM(b7, b6, b5, b4, b3, b2, b1, b0), C \leftarrow MEM(b7)$ Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV |
| <i>swap a</i> | Swap the high nibble and low nibble of ACC Example: <i>swap a</i> ; Result: $a(b3, b2, b1, b0, b7, b6, b5, b4) \leftarrow a(b7, b6, b5, b4, b3, b2, b1, b0)$ Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>swap M</i> | Swap the high nibble and low nibble of memory Example: <i>swap MEM</i> ; Result: $MEM(b3, b2, b1, b0, b7, b6, b5, b4) \leftarrow MEM(b7, b6, b5, b4, b3, b2, b1, b0)$ Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |

7.4. Logic Operation Instructions

| | |
|-----------------|--|
| <i>and a, l</i> | Perform logic AND on ACC and immediate data, then put result into ACC Example: <i>and a, 0x0f</i> ; Result: $a \leftarrow a \& 0fh$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>and a, M</i> | Perform logic AND on ACC and memory, then put result into ACC Example: <i>and a, RAM10</i> ; Result: $a \leftarrow a \& RAM10$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>and M, a</i> | Perform logic AND on ACC and memory, then put result into memory Example: <i>and MEM, a</i> ; Result: $MEM \leftarrow a \& MEM$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>or a, l</i> | Perform logic OR on ACC and immediate data, then put result into ACC Example: <i>or a, 0x0f</i> ; Result: $a \leftarrow a 0fh$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>or a, M</i> | Perform logic OR on ACC and memory, then put result into ACC Example: <i>or a, MEM</i> ; Result: $a \leftarrow a MEM$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>or M, a</i> | Perform logic OR on ACC and memory, then put result into memory Example: <i>or MEM, a</i> ; Result: $MEM \leftarrow a MEM$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |

| | |
|------------------------|--|
| <code>xor a, I</code> | Perform logic XOR on ACC and immediate data, then put result into ACC Example: <code>xor a, 0x0f ;</code> Result: $a \leftarrow a \oplus 0fh$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <code>xor a, IO</code> | Perform logic XOR on ACC and IO register, then put result into ACC Example: <code>xor a, pa ;</code> Result: $a \leftarrow a \oplus pa$; // pa is the data register of port A Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <code>xor IO, a</code> | Perform logic XOR on ACC and IO register, then put result into IO register Example: <code>xor pa, a ;</code> Result: $pa \leftarrow a \oplus pa$; // pa is the data register of port A Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <code>xor a, M</code> | Perform logic XOR on ACC and memory, then put result into ACC Example: <code>xor a, MEM ;</code> Result: $a \leftarrow a \oplus RAM10$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <code>xor M, a</code> | Perform logic XOR on ACC and memory, then put result into memory Example: <code>xor MEM, a ;</code> Result: $MEM \leftarrow a \oplus MEM$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV |
| <code>not a</code> | Perform 1' s complement (logical complement) of ACC Example: <code>not a ;</code> Result: $a \leftarrow \sim a$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV Application Example: <hr/> <pre> mov a, 0x38 ; // ACC=0X38 not a ; // ACC=0XC7 </pre> <hr/> |
| <code>not M</code> | Perform 1' s complement (logical complement) of memory Example: <code>not MEM ;</code> Result: $MEM \leftarrow \sim MEM$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV Application Example: <hr/> <pre> mov a, 0x38 ; mov mem, a ; // mem = 0x38 not mem ; // mem = 0xC7 </pre> <hr/> |
| <code>neg a</code> | Perform 2' s complement of ACC Example: <code>neg a ;</code> Result: $a \leftarrow \overline{\overline{a}}$ Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV Application Example: |

| | |
|------------------|--|
| | <pre> mov a, 0x38 ; // ACC=0X38 neg a ; // ACC=0XC8 </pre> |
| <i>neg</i> M | <p>Perform 2's complement of memory</p> <p>Example: <i>neg</i> MEM;</p> <p>Result: $MEM \leftarrow \overline{MEM}$</p> <p>Affected flags: 『Y』 Z 『N』 C 『N』 AC 『N』 OV</p> <p>Application Example:</p> <pre> mov a, 0x38 ; mov mem, a ; // mem = 0x38 not mem ; // mem = 0xC8 </pre> |
| <i>comp</i> a, M | <p>Compare ACC with the content of memory</p> <p>Example: <i>comp</i> a, MEM;</p> <p>Result: Flag will be changed by regarding as (a - MEM)</p> <p>Affected flags: 『Y』 Z 『Y』 C 『Y』 AC 『Y』 OV</p> <p>Application Example:</p> <pre> mov a, 0x38 ; mov mem, a ; comp a, mem ; // Z flag is set as 1 mov a, 0x42 ; mov mem, a ; mov a, 0x38 ; comp a, mem ; // C flag is set as 1 </pre> |
| <i>comp</i> M, a | <p>Compare ACC with the content of memory</p> <p>Example: <i>comp</i> MEM, a;</p> <p>Result: Flag will be changed by regarding as (MEM - a)</p> <p>Affected flags: 『Y』 Z 『Y』 C 『Y』 AC 『Y』 OV</p> |

7.5. Bit Operation Instructions

| | |
|-------------------|--|
| <i>set0</i> IO.n | <p>Set bit n of IO port to low</p> <p>Example: <i>set0</i> pa.5 ;</p> <p>Result: set bit 5 of port A to low</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>set1</i> IO.n | <p>Set bit n of IO port to high</p> <p>Example: <i>set1</i> pb.5 ;</p> <p>Result: set bit 5 of port B to high</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>swapc</i> IO.n | <p>Swap the nth bit of IO port with carry bit</p> <p>Example: <i>swapc</i> IO.0;</p> |

| | |
|-----------------|--|
| | <p>Result: $C \leftarrow IO.0, IO.0 \leftarrow C$</p> <p>When IO.0 is a port to output pin, carry C will be sent to IO.0;</p> <p>When IO.0 is a port from input pin, IO.0 will be sent to carry C;</p> <p>Affected flags: 『N』 Z 『Y』 C 『N』 AC 『N』 OV</p> <p>Application Example1 (serial output) :</p> <hr/> <pre> ... set1 pac.0 ; // set PA.0 as output ... set0 flag.1 ; // C=0 swapc pa.0 ; // move C to PA.0 (bit operation), PA.0=0 set1 flag.1 ; // C=1 swapc pa.0 ; // move C to PA.0 (bit operation), PA.0=1 </pre> <hr/> <p>Application Example2 (serial input) :</p> <hr/> <pre> ... set0 pac.0 ; // set PA.0 as input ... swapc pa.0 ; // read PA.0 to C (bit operation) src a ; // shift C to bit 7 of ACC swapc pa.0 ; // read PA.0 to C (bit operation) src a ; // shift new C to bit 7, old C </pre> <hr/> |
| set0 M.n | <p>Set bit n of memory to low</p> <p>Example: set0 MEM.5 ;</p> <p>Result: set bit 5 of MEM to low</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| set1 M.n | <p>Set bit n of memory to high</p> <p>Example: set1 MEM.5 ;</p> <p>Result: set bit 5 of MEM to high</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |

7.6. Conditional Operation Instructions

| | |
|-------------------|---|
| ceqsn a, I | <p>Compare ACC with immediate data and skip next instruction if both are equal.</p> <p>Flag will be changed like as ($a \leftarrow a - I$)</p> <p>Example: ceqsn a, 0x55 ;</p> <pre> inc MEM ; goto error ; </pre> <p>Result: If a=0x55, then “goto error” ; otherwise, “inc MEM” .</p> <p>Affected flags: 『Y』 Z 『Y』 C 『Y』 AC 『Y』 OV</p> |
| ceqsn a, M | <p>Compare ACC with memory and skip next instruction if both are equal.</p> <p>Flag will be changed like as ($a \leftarrow a - M$)</p> |

| | |
|--------------------------|--|
| | <p>Example: <code>ceqsn a, MEM;</code></p> <p>Result: If $a = \text{MEM}$, skip next instruction</p> <p>Affected flags: $\text{Y}_Z \text{ Y}_C \text{ Y}_{AC} \text{ Y}_{OV}$</p> |
| <code>cneqsn a, M</code> | <p>Compare ACC with memory and skip next instruction if both are not equal.</p> <p>Flag will be changed like as ($a \leftarrow a - M$)</p> <p>Example: <code>cneqsn a, MEM;</code></p> <p>Result: If $a \neq \text{MEM}$, skip next instruction</p> <p>Affected flags: $\text{Y}_Z \text{ Y}_C \text{ Y}_{AC} \text{ Y}_{OV}$</p> |
| <code>cneqsn a, I</code> | <p>Compare ACC with immediate data and skip next instruction if both are no equal.</p> <p>Flag will be changed like as ($a \leftarrow a - I$)</p> <p>Example: <code>cneqsn a, 0x55;</code> <code>inc MEM;</code> <code>goto error;</code></p> <p>Result: If $a \neq 0x55$, then “goto error” ; Otherwise, “inc MEM” .</p> <p>Affected flags: $\text{Y}_Z \text{ Y}_C \text{ Y}_{AC} \text{ Y}_{OV}$</p> |
| <code>t0sn IO.n</code> | <p>Check IO bit and skip next instruction if it' s low</p> <p>Example: <code>t0sn pa.5;</code></p> <p>Result: If bit 5 of port A is low, skip next instruction</p> <p>Affected flags: $\text{N}_Z \text{ N}_C \text{ N}_{AC} \text{ N}_{OV}$</p> |
| <code>t1sn IO.n</code> | <p>Check IO bit and skip next instruction if it' s high</p> <p>Example: <code>t1sn pa.5;</code></p> <p>Result: If bit 5 of port A is high, skip next instruction</p> <p>Affected flags: $\text{N}_Z \text{ N}_C \text{ N}_{AC} \text{ N}_{OV}$</p> |
| <code>t0sn M.n</code> | <p>Check memory bit and skip next instruction if it' s low</p> <p>Example: <code>t0sn MEM.5;</code></p> <p>Result: If bit 5 of MEM is low, then skip next instruction</p> <p>Affected flags: $\text{N}_Z \text{ N}_C \text{ N}_{AC} \text{ N}_{OV}$</p> |
| <code>t1sn M.n</code> | <p>Check memory bit and skip next instruction if it' s high</p> <p>EX: <code>t1sn MEM.5;</code></p> <p>Result: If bit 5 of MEM is high, then skip next instruction</p> <p>Affected flags: $\text{N}_Z \text{ N}_C \text{ N}_{AC} \text{ N}_{OV}$</p> |
| <code>izsn a</code> | <p>Increment ACC and skip next instruction if ACC is zero</p> <p>Example: <code>izsn a;</code></p> <p>Result: $a \leftarrow a + 1$, skip next instruction if $a = 0$</p> <p>Affected flags: $\text{Y}_Z \text{ Y}_C \text{ Y}_{AC} \text{ Y}_{OV}$</p> |
| <code>dzsn a</code> | <p>Decrement ACC and skip next instruction if ACC is zero</p> <p>Example: <code>dzsn a;</code></p> <p>Result: $A \leftarrow A - 1$, skip next instruction if $a = 0$</p> <p>Affected flags: $\text{Y}_Z \text{ Y}_C \text{ Y}_{AC} \text{ Y}_{OV}$</p> |
| <code>izsn M</code> | <p>Increment memory and skip next instruction if memory is zero</p> <p>Example: <code>izsn MEM;</code></p> <p>Result: $\text{MEM} \leftarrow \text{MEM} + 1$, skip next instruction if $\text{MEM} = 0$</p> <p>Affected flags: $\text{Y}_Z \text{ Y}_C \text{ Y}_{AC} \text{ Y}_{OV}$</p> |
| <code>dzsn M</code> | <p>Decrement memory and skip next instruction if memory is zero</p> <p>Example: <code>dzsn MEM;</code></p> |

| | |
|--|--|
| | Result: $MEM \leftarrow MEM - 1$, skip next instruction if $MEM = 0$ Affected flags: 『Y』 Z 『Y』 C 『Y』 AC 『Y』 OV |
|--|--|

7.7. System control Instructions

| | |
|-------------------|--|
| <i>call</i> label | Function call, address can be full range address space Example: <i>call</i> function1; Result: $[sp] \leftarrow pc + 1$ $pc \leftarrow \text{function1}$ $sp \leftarrow sp + 2$ Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>goto</i> label | Go to specific address which can be full range address space Example: <i>goto</i> error; Result: Go to error and execute program. Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>ret</i> l | Place immediate data to ACC, then return Example: <i>ret</i> 0x55; Result: $A \leftarrow 55h$ <i>ret</i> ; Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>ret</i> | Return to program which had function call Example: <i>ret</i> ; Result: $sp \leftarrow sp - 2$ $pc \leftarrow [sp]$ Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>reti</i> | Return to program from interrupt service routine. After this command is executed, global interrupt is enabled automatically. Example: <i>reti</i> ; Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>nop</i> | No operation Example: <i>nop</i> ; Result: nothing changed Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| <i>pcadd</i> a | Next program counter is current program counter plus ACC. Example: <i>pcadd</i> a; Result: $pc \leftarrow pc + a$ Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV |
| | Application Example: ----- ... mov a, 0x02 ; pcadd a ; // PC <- PC+2 goto err1 ; goto correct ; // jump here goto err2 ; |

| | |
|----------------|---|
| | <pre> goto err3 ; ... correct: // jump here ... </pre> |
| <i>engint</i> | <p>Enable global interrupt enable</p> <p>Example: <i>engint</i>;</p> <p>Result: Interrupt request can be sent to CPU</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>disgint</i> | <p>Disable global interrupt enable</p> <p>Example: <i>disgint</i> ;</p> <p>Result: Interrupt request is blocked from CPU</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>stopsys</i> | <p>System halt.</p> <p>Example: <i>stopsys</i>;</p> <p>Result: Stop the system clocks and halt the system</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>stopexe</i> | <p>CPU halt. The oscillator module is still active to output clock, however, system clock is disabled to save power.</p> <p>Example: <i>stopexe</i>;</p> <p>Result: Stop the system clocks and keep oscillator modules active.</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>reset</i> | <p>Reset the whole chip, its operation will be same as hardware reset.</p> <p>Example: <i>reset</i>;</p> <p>Result: Reset the whole chip.</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |
| <i>wdreset</i> | <p>Reset Watchdog timer.</p> <p>Example: <i>wdreset</i> ;</p> <p>Result: Reset Watchdog timer.</p> <p>Affected flags: 『N』 Z 『N』 C 『N』 AC 『N』 OV</p> |

7.8. Summary of Instructions Execution Cycle

| | | |
|----|----------------------------|---|
| 2T | | <i>goto, call, idxm, pcadd, ret, reti, ldtabl, ldtabh</i> |
| 2T | Condition is fulfilled | <i>ceqsn, cneqsn, t0sn, t1sn, dzsn, izsn</i> |
| 1T | Condition is not fulfilled | |
| 1T | | Others |

7.9. Summary of affected flags by Instructions

| Instruction | Z | C | AC | OV | Instruction | Z | C | AC | OV | Instruction | Z | C | AC | OV |
|---------------------|---|---|----|----|----------------------|---|---|----|----|----------------------|---|---|----|----|
| <i>mov a, l</i> | - | - | - | - | <i>mov M, a</i> | - | - | - | - | <i>mov a, M</i> | Y | - | - | - |
| <i>mov a, IO</i> | Y | - | - | - | <i>mov IO, a</i> | - | - | - | - | <i>ldt16 word</i> | - | - | - | - |
| <i>stt16 word</i> | - | - | - | - | <i>idxm a, index</i> | - | - | - | - | <i>idxm index, a</i> | - | - | - | - |
| <i>xch M</i> | - | - | - | - | <i>pushaf</i> | - | - | - | - | <i>popaf</i> | Y | Y | Y | Y |
| <i>add a, l</i> | Y | Y | Y | Y | <i>add a, M</i> | Y | Y | Y | Y | <i>add M, a</i> | Y | Y | Y | Y |
| <i>addc a, M</i> | Y | Y | Y | Y | <i>addc M, a</i> | Y | Y | Y | Y | <i>addc a</i> | Y | Y | Y | Y |
| <i>addc M</i> | Y | Y | Y | Y | <i>nadd a, M</i> | Y | Y | Y | Y | <i>nadd M, a</i> | Y | Y | Y | Y |
| <i>sub a, l</i> | Y | Y | Y | Y | <i>sub a, M</i> | Y | Y | Y | Y | <i>sub M, a</i> | Y | Y | Y | Y |
| <i>subc a, M</i> | Y | Y | Y | Y | <i>subc M, a</i> | Y | Y | Y | Y | <i>subc a</i> | Y | Y | Y | Y |
| <i>subc M</i> | Y | Y | Y | Y | <i>inc M</i> | Y | Y | Y | Y | <i>dec M</i> | Y | Y | Y | Y |
| <i>clear M</i> | - | - | - | - | <i>mul</i> | - | - | - | - | <i>sr a</i> | - | Y | - | - |
| <i>src a</i> | - | Y | - | - | <i>sr M</i> | - | Y | - | - | <i>src M</i> | - | Y | - | - |
| <i>sl a</i> | - | Y | - | - | <i>slc a</i> | - | Y | - | - | <i>sl M</i> | - | Y | - | - |
| <i>slc M</i> | - | Y | - | - | <i>swap a</i> | - | - | - | - | <i>and a, l</i> | Y | - | - | - |
| <i>and a, M</i> | Y | - | - | - | <i>and M, a</i> | Y | - | - | - | <i>or a, l</i> | Y | - | - | - |
| <i>or a, M</i> | Y | - | - | - | <i>or M, a</i> | Y | - | - | - | <i>xor a, l</i> | Y | - | - | - |
| <i>xor IO, a</i> | - | - | - | - | <i>xor a, M</i> | Y | - | - | - | <i>xor M, a</i> | Y | - | - | - |
| <i>not a</i> | Y | - | - | - | <i>not M</i> | Y | - | - | - | <i>neg a</i> | Y | - | - | - |
| <i>neg M</i> | Y | - | - | - | <i>comp a, M</i> | Y | Y | Y | Y | <i>comp M, a</i> | Y | Y | Y | Y |
| <i>set0 IO.n</i> | - | - | - | - | <i>set1 IO.n</i> | - | - | - | - | <i>set0 M.n</i> | - | - | - | - |
| <i>set1 M.n</i> | - | - | - | - | <i>swapc IO.n</i> | - | Y | - | - | <i>ceqsn a, l</i> | Y | Y | Y | Y |
| <i>ceqsn a, M</i> | Y | Y | Y | Y | <i>cneqsn a, M</i> | Y | Y | Y | Y | <i>cneqsn a, l</i> | Y | Y | Y | Y |
| <i>t0sn IO.n</i> | - | - | - | - | <i>T1sn IO.n</i> | - | - | - | - | <i>t0sn M.n</i> | - | - | - | - |
| <i>t1sn M.n</i> | - | - | - | - | <i>izsn a</i> | Y | Y | Y | Y | <i>dzsn a</i> | Y | Y | Y | Y |
| <i>izsn M</i> | Y | Y | Y | Y | <i>dzsn M</i> | Y | Y | Y | Y | <i>call label</i> | - | - | - | - |
| <i>goto label</i> | - | - | - | - | <i>ret l</i> | - | - | - | - | <i>ret</i> | - | - | - | - |
| <i>reti</i> | - | - | - | - | <i>nop</i> | - | - | - | - | <i>pcadd a</i> | - | - | - | - |
| <i>engint</i> | - | - | - | - | <i>disgint</i> | - | - | - | - | <i>stopsys</i> | - | - | - | - |
| <i>stopexe</i> | - | - | - | - | <i>reset</i> | - | - | - | - | <i>wdreset</i> | - | - | - | - |
| <i>ldtabl index</i> | - | - | - | - | <i>ldtabh index</i> | - | - | - | - | <i>xor a, IO</i> | Y | - | - | - |
| <i>swap M</i> | - | - | - | - | <i>nmov M, a</i> | - | - | - | - | <i>nmov a, M</i> | Y | - | - | - |

7.10. BIT definition

Bit access of RAM is only available for address from 0x00 to 0x7F.

8. Code Options

| Option | Selection | Description |
|-------------------------------------|----------------|---|
| Security | Enable | Security Enable |
| | Disable | Security Disable |
| LVR | 4.0V | Select LVR = 4.0V |
| | 3.5V | Select LVR = 3.5V |
| | 3.0V | Select LVR = 3.0V |
| | 2.7V | Select LVR = 2.7V |
| | 2.5V | Select LVR = 2.5V |
| | 2.2V | Select LVR = 2.2V |
| | 2.0V | Select LVR = 2.0V |
| | 1.8V | Select LVR = 1.8V |
| Boot-up_Time | Slow | Please refer to t_{WUP} and t_{SBP} in Section 4.1 |
| | Fast | Please refer to t_{WUP} and t_{SBP} in Section 4.1 |
| LCD2 (please refer to MISC.4) | Disable | VDD/2 LCD bias voltage generator disabled. All are normal IO pins |
| | PB0_A034 | VDD/2 LCD bias voltage generator enabled, PB0 PA[0,3,4] are VDD/2 if input mode |
| | PB1256 | VDD/2 LCD bias voltage generator enabled, PB[1,2,5,6] are VDD/2 if input mode |
| Interrupt Src0 | PA.0 | INTEN/ INTRQ.Bit0 is from PA.0 |
| | PB.5 | INTEN/ INTRQ.Bit0 is from PB.5 |
| | PA.2 | INTEN/ INTRQ.Bit0 is from PA.2 |
| | PA.7 | INTEN/ INTRQ.Bit0 is from PA.7 |
| Interrupt Src1 | PB.0 | INTEN/ INTRQ.Bit1 is from PB.0 |
| | PA.4 | INTEN/ INTRQ.Bit1 is from PA.4 |
| | PA.3 | INTEN/ INTRQ.Bit1 is from PA.3 |
| | PB.6 | INTEN/ INTRQ.Bit1 is from PB.6 |

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

| Option | Selection | Description |
|--------------------|-----------------|---|
| PB4_PB7_Drive | Normal | PB4 & PB7 Drive/ Sink Current is Normal |
| | Strong | PB4 & PB7 Drive/ Sink Current is Strong |
| Comparator Edge | All_Edge | The comparator will trigger an interrupt on both the rising edge or falling edge |
| | Rising_Edge | The comparator will trigger an interrupt on the rising edge |
| | Falling_Edge | The comparator will trigger an interrupt on the falling edge |
| GPC_PWM | Disable | Comparator does not control all PWM outputs |
| | Enable | Comparator controls all PWM outputs (ICE does NOT Support.) |
| PWM_Source | 16MHZ | When pwm0c.0= 1, PWMG0 clock source = IHRC = 16MHZ When pwm1c.0= 1, PWMG1 clock source = IHRC = 16MHZ When pwm2c.0= 1, PWMG2 clock source = IHRC = 16MHZ |
| | 32MHZ | When pwm0c.0= 1, PWMG0 clock source = IHRC*2 = 32MHZ When pwm1c.0= 1, PWMG1 clock source = IHRC*2 = 32MHZ When pwm2c.0= 1, PWMG2 clock source = IHRC*2 = 32MHZ (ICE does NOT Support.) |
| TMx_Source | 16MHZ | When tm2c[7:4]= 0010, TM2 clock source = IHRC = 16MHZ When tm3c[7:4]= 0010, TM3 clock source = IHRC = 16MHZ |
| | 32MHZ | When tm2c[7:4]= 0010, TM2 clock source = IHRC*2 = 32MHZ When tm3c[7:4]= 0010, TM3 clock source = IHRC*2 = 32MHZ (ICE does NOT Support.) |
| TMx_Bit | 6 Bit | When tm2s.7=1, TM2 PWM resolution is 6 Bit When tm3s.7=1, TM3 PWM resolution is 6 Bit |
| | 7 Bit | When tm2s.7=1, TM2 PWM resolution is 7 Bit When tm3s.7=1, TM3 PWM resolution is 7 Bit (ICE does NOT Support.) |

Note: The **Bolded** options are the default options.

9. Special Notes

This chapter is to remind user who use PMS133/PMS134 series IC in order to avoid frequent errors upon operation.

9.1. Using IC

9.1.1. IO pin usage and setting

- (1) IO pin is set to be digital input
 - ◆ When IO is set as digital input, the level of V_{ih} and V_{il} would changes with the voltage and temperature. Please follow the minimum value of V_{ih} and the maximum value of V_{il} .
 - ◆ The value of internal pull high resistor would also change with the voltage, temperature and pin voltage. It is not the fixed value.
- (2) If IO pin is set to be digital input and enable wake-up function
 - ◆ Configure IO pin as input.
 - ◆ Set corresponding bit to “1” in PXDIER.
- (3) PA5 is set to be output pin
 - ◆ PA5 can be set to be Open-Drain output pin only, output high requires adding pull-high resistor.
- (4) PA5 is set to be PRST# input pin
 - ◆ Configure PA5 as input.
 - ◆ Set CLKMD.0=1 to enable PA5 as PRST# input pin.
- (5) PA5 is set to be input pin and to connect with a push button or a switch by a long wire
 - ◆ Needs to put a $>33\Omega$ resistor in between PA5 and the long wire.
 - ◆ Avoid using PA5 as input in such application.
- (6) PA7 and PA6 as external crystal oscillator
 - ◆ Configure PA7 and PA6 as input
 - ◆ Disable PA7 and PA6 internal pull-high resistor
 - ◆ Configure PADIER register to set PA6 and PA7 as analog input
 - ◆ EOSCR register bit [6:5] selects corresponding crystal oscillator frequency:
 - ✧ 01 : for lower frequency, ex : 32KHz
 - ✧ 10 : for middle frequency, ex : 455KHz, 1MHz
 - ✧ 11 : for higher frequency, ex : 4MHz
 - ◆ Program EOSCR.7 =1 to enable crystal oscillator
 - ◆ Ensure EOSC working well before switching from IHRC or ILRC to EOSC

Note: Please read the PMC-APN013 carefully. According to PMC-APN013, the crystal oscillator should be used reasonably. If the following situations happen to cause IC start-up slowly or non-startup, PADAUK Technology is not responsible for this: the quality of the user's crystal oscillator is not good, the usage conditions are unreasonable, the PCB cleaner leakage current, or the PCB layouts are unreasonable.

9.1.2. Interrupt

- (1) When using the interrupt function, the procedure should be:

Step1: Set INTEN register, enable the interrupt control bit

Step2: Clear INTRQ register

Step3: In the main program, using ENGINT to enable CPU interrupt function

Step4: Wait for interrupt. When interrupt occurs, enter to Interrupt Service Routine

Step5: After the Interrupt Service Routine being executed, return to the main program

* Use DISGINT in the main program to disable all interrupts

* When interrupt service routine starts, use PUSHAF instruction to save ALU and FLAG register. POPAF instruction is to restore ALU and FLAG register before RETI as below:

```
void Interrupt (void)    // Once the interrupt occurs, jump to interrupt service routine
{
    // enter DISGINT status automatically, no more interrupt is
    // accepted

    PUSHAF;
    ...
    POPAF;
} // RETI will be added automatically. After RETI being executed, ENGINT status
  will be restored
```

- (2) INTEN and INTRQ have no initial values. Please set required value before enabling interrupt function.

- (3) There are two sets of external IO pin interrupt source. Every set is decided by code option Interrupt Src0 and Interrupt Src1 corresponding to the unique interrupt pin. Please comply with the *inten / intrq / inteqs* register when selecting IO pin.

9.1.3. System clock switching

System clock can be switched by CLKMD register. **Please notice that, NEVER switch the system clock and turn off the original clock source at the same time.** For example: When switching from clock A to clock B, please switch to clock B first; and after that turn off the clock A oscillator through CLKMD.

- ◆ Example : Switch system clock from ILRC to IHRC/2

```
CLKMD = 0x36;           // switch to IHRC, ILRC can not be disabled here
```

```
CLKMD.2 = 0;           // ILRC can be disabled at this time
```

- ◆ **ERROR:** Switch ILRC to IHRC and turn off ILRC simultaneously

```
CLKMD = 0x50;          // MCU will hang
```

9.1.4. Watchdog

Watchdog is open by default, but when the program executes ADJUST_IC, the watchdog will be closed. To use the watchdog, you need to reconfigure the open. Watchdog will be inactive once ILRC is disabled.

9.1.5. TIMER time out

When select \$ INTEGS BIT_R (default value) and T16M counter BIT8 to generate interrupt, if T16M counts from 0, the first interrupt will occur when the counter reaches to 0x100 (BIT8 from 0 to 1) and the second interrupt will occur when the counter reaches 0x300 (BIT8 from 0 to 1). Therefore, selecting BIT8 as 1 to generate interrupt means that the interrupt occurs every 512 counts. Please notice that if T16M counter is restarted, the next interrupt will occur once Bit8 turns from 0 to 1.

If select \$ INTEGS BIT_F (BIT triggers from 1 to 0) and T16M counter BIT8 to generate interrupt, the T16M counter changes to an interrupt every 0x200/0x400/0x600/. Please pay attention to two differences with setting INTEGS methods.

9.1.6. IHRC

- (1) The IHRC frequency calibration is performed when IC is programmed by the writer.
- (2) Because the characteristic of the Epoxy Molding Compound (EMC) would some degrees affects the IHRC frequency (either for package or COB), if the calibration is done before molding process, the actual IHRC frequency after molding may be deviated or becomes out of spec. Normally, the frequency is getting slower a bit.
- (3) It usually happens in COB package or Quick Turnover Programming (QTP). And PADAUK would not take any responsibility for this situation.
- (4) Users can make some compensatory adjustments according to their own experiences. For example, users can set IHRC frequency to be 0.5% ~ 1% higher and aim to get better re-targeting after molding.

9.1.7. LVR

LVR level selection is done at compile time. User must select LVR based on the system working frequency and power supply voltage to make the MCU work stably.

The following are Suggestions for setting operating frequency, power supply voltage and LVR level:

| SYSCLK | VDD | LVR |
|--------|--------|--------|
| 2MHz | ≧ 2.2V | ≧ 2.2V |
| 4MHz | ≧ 2.5V | ≧ 2.5V |
| 8MHz | ≧ 3.5V | ≧ 3.5V |

Table 9: LVR setting for reference

- (1) The setting of LVR (1.8V ~ 4.0V) will be valid just after successful power-on process.
- (2) User can set MISC.2 as "1" to disable LVR. However, V_{DD} must be kept as exceeding the lowest working voltage of chip; Otherwise IC may work abnormally.
- (3) The LVR function will be invalid when IC in stopexe or stopsys mode.

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

9.1.8. Programming Writing

There are 6 pins for using the writer to program: PA3, PA4, PA5, PA6, VDD and GND.

There are different ways to program for each package when using program writer version differently. Please refer to the following message:

| package | 3S-P-002 | | 5S-P-003x | |
|---------------------|----------|---------------------------------|-----------|------|
| | front | back | front | back |
| SOP8 | shift-4 | CN39[1,8], CN38[3~6] | X (top) | JP7 |
| SOP14/SOP16A | shift-3 | CN38 | shift-4 | JP2 |
| SOP16B | shift-3 | CN33[1,8], CN38[3~6] | X | JP7 |
| SOP20 | shift-2 | CN38[1,8], CN39[3~6] | X | JP1 |
| SOP24/SSOP24 | shift-0 | CN41[1,8], CN38[4,6], CN39[3,5] | X | JP7 |
| MSOP10/DFN3*3-10PIN | shift-4 | CN39[1~4,8], CN38[5,6] | X | JP7 |
| SOT23-6 | shift-0 | CN38 | X | JP7 |
| QFN3*3-16PIN | shift-3 | CN38 | X | JP7 |
| QFN4*4-16PIN | shift-3 | CN38 | shift-4 | JP2 |
| QFN4*4-24PIN | shift-0 | CN41[1,8], CN38[3~6] | X | JP7 |

8Pin: IC downwards
by four spaces
from the top of the Textool

In 3S-P-002, for SOP8
package, put the
jumper over CN39[1, 8]
and CN38[3 to 6]

Please refer to its user manual to learn JP7 jumper method when using 5S-P-003x to program.

- Special notes about voltage and current while Multi-Chip-Package (MCP) or On-Board Programming
 - (1) PA5 (V_{PP}) may be higher than 11V.
 - (2) V_{DD} may be higher than 6.5V, and its maximum current may reach about 20mA.
 - (3) All other signal pins level (except GND) are the same as V_{DD} .

User should confirm when using this product in MCP or On-Board Programming, the peripheral circuit or components will not be destroyed or limit the above voltages.

9.1.9. Programming Compatibility

PMS133 and PMS134 are directional compatible. PMS133 program can write into PMS134 real chip, but not vice versa.

9.2. Using ICE

5S-I-S01/2(B) supports PMS133/PMS134 MCU emulation, the following items should be noted when using 5S-I-S01/2(B) to emulate PMS133/PMS134:

- 5S-I-S01/2(B) doesn't support the instruction NMOV/SWAP/NADD/COMP with RAM.
- 5S-I-S01/2(B) doesn't support $SYSCLK=ILRC/16$.
- 5S-I-S01/2(B) doesn't support the dynamic setting of function ***misc.4*** (Only fix to 0 or 1)
- 5S-I-S01/2(B) doesn't support the function ***Tm2.gpcrs/Tm3.gpcrs***.
- 5S-I-S01/2(B) doesn't support bandgap reference voltage for ADC channel F of ADCRGC [3:2]. Only 1.2V exists and is fixed.
- 5S-I-S01/2(B) has different setting of PC2 and PC1 in ***adcc***.
- 5S-I-S01/2(B) doesn't support the code options: GPC_PWM, TMx_source, PWM_Source and TMx_bit.
- 5S-I-S01/2(B) only has 240 bytes RAM for data memory.
- 5S-I-S01/2(B) only has 0xF00 program memory.
- The PCDIER register of the 5S-I-S01/2(B) emulator is different from the real chip. The PCDIER[0] of the 5S-I-S01/2(B) is used to set PC0~PC3 to be digital input whereas PCDIER[1] is used to set PC4~ PC7 to be digital input. It is recommended not to set PCDIER.
- When using PB1 in ADCRGC, PA1 must float.
- When GPCS selects output to PA0, the output function of PA3 will be affected.
- When simulating PWM waveform, please check the waveform during program running. When the ICE is suspended or single-step running, its waveform may be inconsistent with the reality.
- The ILRC frequency of the 5S-I-S01/2(B) simulator is different from the actual IC and is uncalibrated, with a frequency range of about 34K~38KHz.

PMS133/PMS134

8bit OTP MCU with 12-bit ADC

- When using 5S-I-S01/2(B) for simulation, changing the value of tm2ct/tm3ct will affect the duty during timer2/timer3 period mode. But it will not be affected for the actual IC.
- With 5S-I-S01/2(B) simulation, when fast wake-up is enabled, the watchdog overflow reset time becomes very short. Actually, it has not effect on IC.
- The power-down command Stopsys does not support the comparator wake-up function. When using 5S-I-S01/2 (B), it should be noted that the comparator enable should be set to the off state before entering the power-down mode. If the enable state is turned on, the comparator will be mistakenly awakened.
- Fast Wakeup time is different from 5S-I-S01/2(B): 128 SysClk, PMS133/PMS134: 45 ILRC
- Watch dog time out period is different from 5S-I-S01/2(B):

| WDT period | 5S-I-S01/2(B) | PMS133/PMS134 |
|--------------|---------------------------|----------------------------|
| misc[1:0]=00 | 2048 * T _{ILRC} | 8192 * T _{ILRC} |
| misc[1:0]=01 | 4096 * T _{ILRC} | 16384 * T _{ILRC} |
| misc[1:0]=10 | 16384 * T _{ILRC} | 65536 * T _{ILRC} |
| misc[1:0]=11 | 256 * T _{ILRC} | 262144 * T _{ILRC} |
